## Applicability

### Changelog

Issue A.0: First draft

Issue B.0: Added C4 & DANTE to engineering menu control & correct 0x13

Issue C.0: Removed commands 0x39/0x3A as not longer used, Auro commands 0x10, 0x11 & 0x28 updated. Dolby Centre spread removed from 0x29, Leveller & Calibration Offset removed from 0x28. Added Auro Native & Auro 2D IR commands.

Issue D.0: Added Auro channel responses to 0x43 / 0x29. Correct Bass -1 IR comamnd.

Issue E.0: Added SDR-38/SDP-58

# Controlling via RS232/NET

## Introduction

This document describes the remote control protocol for controlling via the RS232/NET interface. The AV implements virtual IR commands in order to simplify the protocol. Any operation that can be invoked using the IR remote control can be achieved over a control link using the Simulate RC5 IR command (0x08). See page 7 for details of this command. The RC5 IR code set is listed from page 39.

## Set-up

The AV must be correctly configured for Control; by default, Control is disabled for minimum standby power consumption. RS232 control can be enabled using the front panel: press and hold the front panel **DIRECT** button for 4 seconds until "RS232 CONTROL ON" is displayed on the VFD. Alternatively, Control for RS232 or IP can be enabled using the OSD menu. Press **(AMP)** followed by **(MENU)** on the remote control in order to access the setup menu. Use the cursor keys **(←)**, **(→)**, **(↑)**, **(↓)** and **(OK)** to enter the General Setup menu and locate the option **Control**. Press **(OK)**, **(↓)** then **(OK)** to change this parameter to 'On'. IP control is via port 50000 of the IP address of the unit (in the Network Settings menu).

## Conventions

- All hexadecimal numbers begin 0x.
- Any character in single quotes gives the ASCII equivalent of a hex value.
- <n> represents an unknown or variable number.

---

## Serial Cable Specification

The cable is wired as a null modem:

Connector 1 pin	Connector 2 pin	Function
2	3	Rx ← Tx
3	2	Tx → Rx
5	5	RS232 Ground

## Data transfer format

- Transfer rate: 38,400bps.
- 1 start bit, 8 data bits, 1 stop bit, no parity, no flow control.

---

## Command and response formats

Communication between the remote controller (RC) and the AV takes the form of sequences of bytes, with all commands and responses having the same basic format. The AV shall always respond to a received command, but may also send messages at other times.

Each transmission by the RC is the following format:

<St> <Zn> <Cc> <Dl> <Data> <Et>

- St (Start transmission): 0x21 '!'
- Zn (Zone number): see below.
- Cc (Command code): the code for the command
- Dl (Data length): the number of data items following this item, excluding the ETR
- Data: the parameters for the command
- Et (End transmission): 0x0D

Each response by the AVR is the following format::

<St> <Zn> <Cc> <Ac> <Dl> <Data> <Et>

- St (Start transmission): 0x21 '!'
- Zn (Zone number): see below.
- Cc (Command code): the code for the command
- Ac (Answer code): see below.
- Dl (Data Length): the number of data items following this item, excluding the ETR
- Data: the parameters for the response of length n. n is limited to 255.
- Et (End transmission): 0x0D

The AV responds to each command from the RC within three seconds. The RC may send further commands before a previous command response has been received.

## Zone numbers

The following zone numbers are defined:

- 0x01 – Zone number 1. (Zone 1 is the master zone. Commands that appear zone-less refer to the master zone)
- 0x02 – Zone number 2.

## Answer codes

The following answer codes are defined:

- 0x00 – Status update.
- 0x82 – Zone Invalid.
- 0x83 – Command not recognised.
- 0x84 – Parameter not recognised.
- 0x85 – Command invalid at this time.<sup>1</sup>
- 0x86 – Invalid data length.

<sup>1</sup>Certain commands cannot be processed when the Setup Menu is being displayed. An answer code of 0x85 will be returned in these circumstances. Also, commands for tuner control cannot be processed when the tuner input is not selected, etc.

## State changes as a result of other inputs

It is possible that the state of the AV may be changed as a result of user input via the front panel buttons or via the IR remote control. Any change resulting from these inputs is relayed to the RC using the appropriate message type.

For example, if the user changed the front panel display brightness using the DISPLAY button on the front panel, a display message (defined below) would be sent to the RC. A similar action would be taken for all other state changes (including decode mode changes).

## Reserved Commands

---

Commands 0xF0 to 0xFF (inclusive) are reserved for test functions and should never be used.

## Example command and response sequence

As an example, the command to simulate the RC5 command “16-16”, volume up:

STR	ZONE	CC	DL	Data 1	Data 2	ETR
0x21	0x01	0x08	0x02	0x10	0x10	0x0D

Assuming that the command was accepted by the AV Receiver and is being processed, the AV responds to this command with the following sequence:

STR	ZONE	CC	AC	DL	Data 1	Data 2	ETR
0x21	0x01	0x08	0x00	0x02	0x10	0x10	0x0D

## AMX Duet™ Support

The AV shall be fully compatible with AMX Duet™ Dynamic Device Discovery Protocol (DDDP). The following description of Dynamic Device Discovery comes from the AMX website ([www.amx.com](http://www.amx.com)). Dynamic Device Discovery is part of AMX's Duet™ platform, which combines the proven reliability and power of NetLinX with the extensive capabilities of the Java 2 Micro Edition (J2ME) platform. When integrating a serial or IP device from a manufacturer embedding the Dynamic Device Discovery Protocol (DDDP), Duet recognizes the device and loads the appropriate Duet module, which automatically installs the new device. AMX's NetLinX Master can then find and install the Duet device module either from a library on the master, from AMX's Web site, or from the manufacturer's Web site. Duet also allows for device swapping so that programming changes are not required when devices with DDDP are removed or replaced – a huge benefit for end users. The Duet platform is an extension AMX's InConcert® manufacturer partner program, which was developed to ensure seamless communication between partners' devices and the AMX control system.

Data is specified in the ASCII format. All ASCII characters between the quotes "" should be recognised/transmitted. "\r" is a carriage return (0x0D)

Command: "AMX\r"

SDP-55 Response:

"AMXB<Device-SDKClass=Receiver><Device-Make=JBL><Device-Model=modelname><Device-Revision=x.y.z>\r"

Where

x.y.z = RS232 protocol version number.

## Control 4 SDDP Support

The AV shall be fully compatible with the Control 4 SDDP discovery protocol.

# System Command Specifications

## Power (0x00)

Request the stand-by state of a zone.

### Example

Command/response sequence to request the power state of zone 1 where zone 1 has power on:

Command: 0x21 0x01 0x00 0x01 0xF0 0x0D

Response: 0x21 0x01 0x00 0x00 0x01 0x01 0x0D

COMMAND:	
Byte:	Description:
St	0x21
Zn	Zone number
Cc	0x00
Dl	0x01
Data	0xF0 – Request power state
Et	0x0D
RESPONSE:

Zn	Zone number
Cc	0x00
Ac	Answer code
Dl	0x01
Data	0x00 – Zone is in stand-by 0x01 – Zone is powered on
Et	0x0D

## Display Brightness (0x01)

Request the brightness of the front panel display.

### Example

Command/response sequence for requesting the brightness of the display where the display is off:

Command: 0x21 0x01 0x01 0x01 0xF0 0x0D

Response: 0x21 0x01 0x01 0x00 0x01 0x00 0x0D

COMMAND:	
Byte:	Description:
St	0x21
Zn	0x01
Cc	0x01

## Headphones (0x02)

Determine whether headphones are connected.

### Example

Command/response sequence to request the headphone status where the headphones are not connected:

Command: 0x21 0x01 0x02 0x01 0xF0 0x0D

Response: 0x21 0x01 0x02 0x00 0x01 0x00 0x0D

COMMAND:	
Byte:	Description:
St	0x21
Zn	0x01
Cc	0x02
Dl	0x01
Data	0xF0 – Request current headphone connection status
Et	0x0D
RESPONSE:

Et	0x0D

### FM genre (0x03)

Request information on the current station programme type from FM source in a given zone. If FM is not selected on the given zone an error 0x85 is returned.

#### Example

Command/response sequence to request the programme type on zone 1 where the programme type is "POP MUSIC":

Command: 0x21 0x01 0x03 0x01 0xF0 0x0D

Response: 0x21 0x01 0x03 0x00 0x09 0x50 0x4F 0x50 0x20 0x4D  
0x55 0x53 0x49 0x43 0x0D

COMMAND:	
Byte:	Description:

### Software version (0x04)

Request the version number of the various pieces of software on the AVR.

#### Example

Command/response sequence to request the RS232 protocol version (1.4):

Command: 0x21 0x01 0x04 0x01 0xF0 0x0D

Response: 0x21 0x01 0x04 0x00 0x03 0xF0 0x01 0x04 0x0D

COMMAND:

Et	0x0D

### Restore factory default settings (0x05)

Force a restore of the factory default settings.

#### Example

Command/response sequence to restore factory defaults:

Command: 0x21 0x01 0x05 0x02 0xAA 0xAA 0x0D

Response: 0x21 0x01 0x05 0x00 0x00 0x0D

COMMAND:

### Save/Restore secure copy of settings (0x06)

Force a restore of the secure copy of the settings. Note: If no secure copy has been made, this command will return an answer code of 0x85.

If the system is currently doing a save and another save is requested. The second save will fail silently. If a command 0x1E is being processed this command will fail with a answer code 0x85

#### Example

Command/response sequence to restore secure backup:

Command: 0x21 0x01 0x06 0x07 0x01 0x55 0x55 0x01 0x02 0x03 0x040x0D

### Simulate RC5 IR Command (0x08)

Simulate an RC5 command via the RS232 port. An additional status message will be sent in most cases as a result of the IR command.

#### Example

Command/response sequence to RC5 16-17 (AVR volume down in zone 1):

Command: 0x21 0x01 0x08 0x02 0x10 0x11 0x0D

Response: 0x21 0x01 0x08 0x00 0x02 0x10 0x11 0x0D

## Display Information Type (0x09)

Set the VFD display information type (where applicable).

The return data echoes the data sent.

### Example

Command/response sequence to set the display text to show the current FM radio text with FM playing in zone 2:

Command: 0x21 0x02 0x09 0x01 0x01 0x0D

Response: 0x21 0x02 0x09 0x00 0x01 0x01 0x0D

## Request current source (0x1D)

Request the source currently selected for a given zone.

### Example

Command/response sequence to request the current source for Zone 1 where the source is set to 'SAT':

Command: 0x21 0x01 0x1D 0x01 0xF0 0x0D  
Response: 0x21 0x01 0x1D 0x00 0x01 0x04 0x0D

## Headphone Over-ride (0x1F)

Activate/deactivate the mute relays (does not zero the volume).

### Example

Command/response sequence to activate the mute relays:

Command: 0x21 0x01 0x1F 0x01 0x01 0x0D  
Response: 0x21 0x01 0x1F 0x00 0x01 0x01 0x0D

# Input Command Specifications

## Select analog/digital (0x0B)

Select an analog/digital audio input for the current source. Returns invalid (0x85) if OSD is showing setup screen.

### Example

Command/response sequence to change the audio input to 'digital' in zone 1:

Command: 0x21 0x01 0x0B 0x01 0x01 0x0D

Response: 0x21 0x01 0x0B 0x00 0x01 0x01 0x0D

# Output Command Specifications

## Set/Request Volume (0x0D)

Set or request the volume of a zone.

This command returns the volume even if the zone requested is in mute. The "Request Mute status" command can be used to discover if the zone is muted.

Response data format:

e.g. for volume 42dB: Data1=0x2A (42)

### Example

Command/response sequence for setting the volume in Zone 1 to 45dB:

Command: 0x21 0x01 0x0D 0x01 0x2D 0x0D

Response: 0x21 0x01 0x0D 0x00 0x01 0x2D 0x0D

## Request Mute status (0x0E)

Request the mute status of the audio in a zone.

### Example

Command/response sequence to request the mute status of zone 1 where zone 1 is muted:

Command: 0x21 0x01 0x0E 0x01 0xF0 0x0D

Response: 0x21 0x01 0x0E 0x00 0x01 0x00 0x0D

## Request direct mode status (0x0F)

Request the direct mode status on Zone 1.

### Example

Command/response sequence to request the Direct mode status in zone 1 where the mode is direct:

Command: 0x21 0x01 0x0F 0x01 0xF0 0x0D

Response: 0x21 0x01 0x0F 0x00 0x01 0x01 0x0D

### Request decode mode status — 2ch (0x10)

Request the decode mode for two-channel material in zone 1.

#### Example

Command/response sequence to request the decode mode in zone 1 where the mode is Dolby Surround Mode:

Command: 0x21 0x01 0x10 0x01 0xF0 0x0D

Response: 0x21 0x01 0x10 0x00 0x01 0x04 0x0D

## Tune (0x16)

Increment/Decrement the tuner frequency in 0.05MHz steps (FM).

The returned frequency is calculated as follows:

FM freq. (MHz) = reported freq. (MHz)

FM freq. (kHz) = reported freq. (kHz)

For these reasons, this command may return values that cannot be translated into ASCII characters.

If the tuner is not selected on the given zone an error 0x85 is returned.

### Example

Command/response sequence to increment the FM tuning from 85.0MHz to 85.05MHz in zone 1:

Command: 0x21 0x01 0x16 0x01 0x01 0x0D

## AV RC5 command codes

These codes are recognised as infra-red signals received by the front panel, RC5 electrical signals received by the remote in jacks and as control data using the 'Simulate RC5 IR Command' (0x 08).

### Basic Functions

These RC5 codes are present on the supplied IR remote control and provide control over basic amplifier and video processing functions.
