Please be sure to check www.jblsynthesis.com for the latest version of this guide, Firmware updates, and other support material.
Safety Guidelines

Important Safety Instructions

1. Read these instructions.
2. Keep these instructions.
3. Heed all warnings.
4. Follow all instructions.
5. Do not use this apparatus near water.
6. Clean only with dry cloth.
7. Do not block any ventilation openings. Install in accordance with the manufacturer's instructions.
8. Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.
9. Do not defeat the safety purpose of the polarized or grounding-type plug.
   A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wide blade and the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
10. Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.
11. Only use attachments/accessories specified by the manufacturer.
12. Use only with the cart, stand, tripod, bracket, or table specified by the manufacturer, or sold with the apparatus.
   When a cart is used, use caution when moving the cart/apparatus combination to avoid injury from tip-over.
13. Unplug this apparatus during lightning storms or when unused for long periods of time.
14. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, images appear distorted, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
15. Object or liquid entry WARNING – Take care that objects do not fall and liquids are not spilled into the enclosure through any openings. The equipment shall not be exposed to dripping or splashing. Liquid-filled objects such as vases should not be placed on the equipment.
16. Climate
   The equipment has been designed for use in moderate climates and in domestic situations.
17. Cleaning
   Unplug the unit from the mains supply before cleaning.
   The case should normally only require a wipe with a soft, lint-free cloth. Do not use chemical solvents for cleaning.
   Do not use furniture cleaning sprays or polishes as they can cause permanent marks.
18. Power sources
   Only connect the equipment to a power supply of the type described in the operating instructions or as marked on the equipment.
   The primary method of isolating the equipment from the mains supply is to remove the mains plug. The equipment must be installed in a manner that makes disconnection possible.
19. Abnormal smell
   If an abnormal smell or smoke is detected from the equipment, turn the power off immediately and unplug the equipment from the wall outlet. Contact your dealer and do not reconnect the equipment.
20. Damage requiring service
   The equipment should be serviced by qualified service personnel when:
   A. The power-supply cord or the plug has been damaged, or
   B. Objects have fallen, or liquid has spilled into the equipment, or
   C. The equipment has been exposed to rain, or
   D. The equipment does not appear to operate normally or exhibits a marked change in performance, or
   E. The equipment has been dropped or the enclosure damaged.

Warning
Mains plug/appliance coupler is used to disconnect device and it shall remain readily operable.

Safety Compliance
This equipment has been designed to meet the IEC/EN 60065 international electrical safety standard. This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
1. This device may not cause harmful interference, and
2. This device does not accept any interference received, including interference that may cause undesired operation.

The building installation shall be regarded as providing protection in accordance with the rating of the wall socket outlet.

Caution on installation
For proper heat dispersal, do not install this unit in a confined space, such as a bookcase or similar enclosure.
- More than 0.3m (1.2in) is recommended.
- Do not place any other equipment on this unit.

Class II product
This equipment is a Class II or double insulated electrical appliance. It has been designed in such a way that it does not require a safety connection to electrical earth (‘ground’ in the U.S.)
FCC Information (for US customers)

PRODUCT
This product complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:
1. This device may not cause harmful interference, and
2. This device must accept any interference received, including interference that may cause undesired operation.

IMPORTANT NOTICE: DO NOT MODIFY THIS PRODUCT
This product, when installed as indicated in the instructions contained in this manual, meets FCC requirements. Modification not expressly approved by JBL SYNTHESIS may void your authority, granted by the FCC, to use the product.

NOTE
This product has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation.
Products generating, using, and radiating radio frequency energy, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. If this product does cause harmful interference to radio or television reception, which can be determined by turning the product OFF and ON, the user is encouraged to try to correct the interference by one or more of the following measures:
- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the product into an outlet on a circuit different from that to which the receiver is connected.
- Consult the local retailer authorized to distribute this type of product or an experienced radio/TV technician for help.

Safety Information (for European customers)

Avoid high temperatures. Allow for sufficient heat dispersion when installed in a rack.
- Handle the power cord carefully. Hold the plug when unplugging the cord.
- Keep the unit free from moisture, water, and dust.
- Unplug the power cord when not using the unit for long periods of time.
- Do not obstruct the ventilation holes.
- Do not let foreign objects into the unit.
- Do not let insecticides, benzene, and thinner come in contact with the unit.
- Never disassemble or modify the unit in any way.
- Ventilation should not be impeded by covering the ventilation openings with items, such as newspapers, tablecloths or curtains.
- Naked flame sources such as lighted candles should not be placed on the unit.
- Observe and follow local regulations regarding battery disposal.
- Do not expose the unit to dripping or splashing fluids.
- Do not place objects filled with liquids, such as vases, on the unit.
- Do not handle the mains cord with wet hands.
- When the switch is in the OFF position, the equipment is not completely switched off from MAINS.
- The equipment shall be installed near the power supply so that the power supply is easily accessible.

A note about recycling
This product's packaging materials are recyclable and can be reused. Please dispose of any materials in accordance with the local recycling regulations.
When discarding the unit, comply with local rules or regulations.
Batteries should never be thrown away or incinerated but disposed of in accordance with the local regulations concerning battery disposal.
This product and the supplied accessories, excluding the batteries, constitute the applicable product according to the WEEE directive.

Correct disposal of this product
These markings indicate that this product should not be disposed with other household waste throughout the EU.

To prevent possible harm to the environment or human health from uncontrolled waste disposal and to conserve material resources, this product should be recycled responsibly.
To dispose of your product, please use your local return and collection systems or contact the retailer where the product was purchased.
Welcome

Thank you and congratulations... for purchasing your JBL Synthesis Immersive Surround Sound Processor.

The JBL Synthesis SDR-35 Class G Immersive Surround Sound AV Receiver and SDP-55 Surround Sound Processor are designed to ensure exceptional performance without compromise. With best-in-class audio and video signal integrity, 16 channels of native processing, Dolby Atmos®, DTS:X®, Auro 3D®, IMAX® Enhanced, Dirac Live®, Logic16™, Network Streaming, Dante® and Class G amplification, the JBL Synthesis® SDR-35 and SDP-55 deliver a powerful, sensory-rich experience with unrivaled flexibility.

Immerse Yourself
Best in class audio and video signal integrity and processing, as well as uncompromising Class G amplification, ensure exceptional transparency even with the most demanding program material. An audiophile-grade 24 Bit / 192kHz ESS Sabre Pro DAC, combined with Dirac Live room equalization and the exceptional dynamics and low distortion of Class G amplification ensure pristine sound for music and movies. The Harman proprietary Logic 16 up mixer allows content to envelop the listener with a rich and natural three dimensional sound, no matter the source format.

Your Content Your way
Many high-end AVR’s exclude real world everyday conveniences for the end-user. The SDR-35 provides a variety of ways to experience content whether using an elaborate network media server over Ethernet or Wi-Fi or simply streaming directly from your tablet or phone via Bluetooth with aptX™ HD. You can source content from a smart TV with high-resolution audio via eARC, utilize Chromecast® built-in and Apple® AirPlay 2™. Use the MusicLife™ app to play your own music library from a computer or NAS drive, or play directly from a USB flash drive. There’s even a DAB/FM antenna for OTA radio!

Superior Video
Advanced circuitry and decades of know-how ensure the 4K "Ultra HD" video signal is perfectly clear and rock solid. The video stages are designed to harness the latest technology and deliver the best quality formats including Dolby Vision™, HLG, HDR10, HDR10+, HDR1400, HDM1.2.0b with HDCP2.2, and 3D video capabilities built-in.

IMAX Enhanced
JBL Synthesis® SDR-35 and SDP-55 are IMAX Enhanced-certified AV processors and feature DTS:X immersive audio decoding that is optimized to properly reproduce the full dynamic range of IMAX theatrical sound mixes available in IMAX Enhanced content. With meticulous adjustments modeled on the IMAX theatrical sound system, this proprietary IMAX audio mix is translated for home theater environments and exclusively delivered using a special variant of the DTS:X CODEC technology to deliver the IMAX signature sound experience in the home.

A More Dramatic TV Experience
Dolby Vision™ is superior HDR. Using the same underlying technology as the most advanced movie theatres, Dolby Vision enables an enhanced image through superior content and smarter TV display performance.

Audiophile Quality
The SDR-35 and SDP-55 leverage the 24bit / 192kHz ESS® Sabre 9028 Pro featuring 114dB dynamic range and -100 THD+N in and out, for A/D and D/A conversion. The analog circuitry on the input and output stages is optimized for unequaled dynamic range, ultra-low distortion, and unmatched audio clarity. Carefully designed anti-jitter circuitry and ultra-clean power supplies are incorporated to ensure all audio paths, including HDMI, are uncompromised.

Class G Amplification – The Best of Both Worlds
The SDR-35 AV Receiver features seven channels of Class G amplification. Class G offers greater efficiency and transparency, with less wasted heat energy than class A. Like a hybrid car engine, Class G implements multiple power supplies. The first power supply runs in pure Class A, which has no crossover distortion. If a dynamic signal is received that goes beyond the capability of this first power supply, the secondary supply is gradually incorporated up to full rated power output as required. This efficient design means additional power is only used when required. Modern high-speed silicon allows this switch to take place well beyond the audio bandwidth. Multiple output devices within the amplifier ensure your listening experience is powerful, dynamic and crystal clear.

Flexibility
With 15.1 decoding, 9.1.6 preamp outputs, plus seven channels of amplification, independent Zone 2 combined with RS232, Ethernet and app control, the SDR-35 and SDP-55 offer exceptional versatility. Four of the sixteen channels allow independent volume and delay settings for added configuration options. Independent volume control for the subwoofers allow fine-tuning, and front panel headphone and aux (3.5mm) jacks add convenience. The JBL Synthesis Control app enables complete control of the SDR-35 with an Android or iOS device. Flexible configuration, including Dante, IP, IR, and RS232 control and a Zone 2 with high-resolution audio, 4K video, IR, triggers, and power option, make the SDR-35 an outstanding choice for a broad range of applications.

For the latest version of this guide, Firmware updates, and other support material, and links, please be sure to check www.jblsynthesis.com.

JBL Synthesis Development Team
Professional installation?

It may be that the Receiver has been installed and set up as part of your Hi-Fi installation by a qualified JBL Synthesis dealer. In this case, you may wish to skip the sections of this handbook dealing with installation and setting up, and move directly to the sections dealing with using the unit. Use the Contents list to guide you to these sections.

DIY setup?

The Receiver is a powerful and sophisticated piece of AV equipment. If you are setting the unit up yourself, it is recommended that you read this handbook thoroughly before beginning. For instance, correct speaker configuration and placement is a key to getting the most out of your Receiver and making sure that all the elements of your system work in harmony.
Before You Begin...

JBL Synthesis Receiver

The JBL Synthesis receiver and processor are high-quality and high-performance private-cinema processors and amplifiers built to JBL Synthesis’ quality design and manufacturing standards. They combine digital processing with high-resolution audio and video components to bring you an unrivalled home-entertainment experience.

The Receiver allows switching and control of seven analog and six digital audio sources in addition to internal FM and DAB+ radios – as well as networked audio sources – making any of the models an ideal hub for both home-cinema and two-channel stereo systems.

Since many of these source components are also capable of generating video signals, the Receiver includes broadcast-quality switching for HDMI (7 x HDMI2.0b, HDCP2.2) video/audio signals. Control of the Receiver is either by front panel control buttons, IR remote control, IP (Ethernet) control or RS232 port.

The remote control supplied with the Receiver is a multi-device universal learning remote control which is simple to use, and once set up is able to control a complete system. It can be programed using its vast internal code library to control CD and BD players, PVRs, TVs and other devices.

The installation of the Receiver in a listening room is an important process which requires care at every stage. For this reason, the installation information is very comprehensive and should be followed carefully to achieve an unrivalled level of performance.

The JBL Synthesis SDR-35 and SDP-55 are designed to ensure a powerful, sensory-rich experience with exceptional clarity and realism.
Placing the unit

- Place the unit on a level, firm surface, avoiding direct sunlight and sources of heat or damp.
- Do not place the Receiver on top of a power amplifier or other source of heat.
- Do not place the amplifier in an enclosed space such as a bookcase or closed cabinet unless there is good provision for ventilation (see page EN-2). The Receiver will run warm during normal operation.
- Do not place any other component or item on top of the amplifier as this may obstruct airflow around the heat-sink, causing the amplifier to run hot. (The unit placed on top of the amplifier would become hot, too.)
- Make sure the remote-control receiver on the front panel display is unobstructed, otherwise this will impair the use of the remote-control. If line-of-sight is impractical, a remote-control repeater can be used with the rear panel connector (see page EN-34).
- Do not place your turntable on top of this unit. Turntables are very sensitive to the noise generated by mains power supplies which will be heard as a background ‘hum’ if the turntable is too close.

Power

The amplifier is supplied with a molded AC plug already attached to the cord. Check that the plug supplied fits your outlet – should you require a new power cord, please contact your JBL Synthesis dealer.

If your AC voltage supply or power cord is different, please contact your JBL Synthesis dealer immediately.

The Receiver can be switched for operation between 220–240V (switch position 230V) and 110–120V (switch position 115V).

NOTE: Ensure that the Receiver is switched off and the power cord removed before changing the position of the voltage range switch.

Push the IEC plug end of the power cord into the socket on the back of the amplifier, making sure that it is pushed in firmly. Plug the other end of the cord into your AC outlet.

The Receiver can be turned on using the power switch on the front panel. While switched on, the front panel LED will glow white.

Standby power

The Receiver can be switched into standby mode using the button on the remote control. While in standby mode the front panel LED will glow red and (with default settings) power consumption is less than 0.5 Watts.

While in Standby mode, it may be possible to hear a slight residual hum coming from the mains transformer inside the amplifier. This is perfectly normal. However, if the unit is to be left unused for an extended period, we recommend that you disconnect it from the AC outlet to save power.

Interconnect cables

We recommend the use of high-quality shielded cables that are designed for the particular application. Other cables will have different impedance characteristics that will degrade the performance of your system (for example, do not use cabling intended for video use to carry audio signals). All cables should be kept as short as is practically possible.

It is good practice when connecting your equipment to make sure that the AC power-supply cabling is kept as far away as possible from your audio cables. Failure to do so may result in unwanted noise in the audio signals.

For information on speaker cables, please refer to the ‘Speakers’ section, beginning on page EN-16.

Radio interference

The Receiver is an audio device containing microprocessors and other digital electronics. Each model has been designed to very high standards of electromagnetic compatibility.

This is a Class A product. In a domestic environment this product may cause radio interference, in which case the user may be required to take adequate measures.

If the Receiver causes interference to radio or television reception (which can be determined by switching the Receiver off and on), the following measures should be taken:

- Re-orient the receiving antenna or route the antenna cable of the affected device as far as possible from the JBL Synthesis Receiver and its cabling.
- Relocate the affected device with respect to the JBL Synthesis Receiver.
- Connect the affected device and the Receiver to different mains outlets.

If the problem persists, please contact your JBL Synthesis dealer.
Trademark Acknowledgments

Dolby Atmos, Dolby Vision, and Dolby Audio are registered trademarks of Dolby Laboratories.

DTS:X®
For DTS patents, see http://patents.dts.com. Manufactured under license from DTS Licensing Limited. IN NO EVENT SHALL THE FOUNDATION OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.
Rear Panel Connections and Controls

Please read the 'Placing the unit', 'Power' and 'Interconnect cables' sections on page EN-7 before connecting up your Receiver!

Contains Transmitter module
FCC ID: APILUXASTR01
IC: 6132A-LUXASTR01
Contains Transmitter module
FCC ID: APILUXABT01
IC: 6132A-LUXABT01

Networking Connectors
For information, see page EN-13, EN-14.

DanTE Ports
For information, see page EN-10.

HDMI Connectors
For information, see page EN-10.

Digital Connectors
Coaxial and optical digital audio connectors, see page EN-11.

Network/Bluetooth Connectors
For information, see page EN-13,

Serial and IR Control
Serial control, trigger and IR connectors, see page EN-14.

Preamplifier Inputs
See page EN-11.

USB Port
See page EN-14.

Preamplifier Outputs
See page EN-11.

Speaker Connectors
For information, see page EN-16.

Power
Connect the correct mains cable here

Voltage Select
Ensure the voltage selected matches your local power supply.

FM/DAB
FM aerial socket, or DAB aerial socket.
Before connecting your Receiver to your source components and speakers, please read through the next few pages which will explain all the input and output connectivity that is available. The 'Speakers' section explains how to connect up your speakers to avoid damage to the amplifier and how to arrange your speakers for best performance.

**General**

The inputs are named to make it easier to reference connected devices (e.g. BD or UHD). They all have the same input circuit, so there is no reason why you should not connect a different device to any of the inputs. For example, if you had two BD players and the AV input was not being used, then the second BD player could be connected to the AV input.

When connecting a video source, its audio must be connected to the corresponding sockets. For example, if you had a satellite decoder plugged into a video input, the audio must be connected to the audio inputs!

**Making connections**

- Take care to place cables as far from any power supply cables as is practicable, to reduce hum and other noise problems.

**NOTE:** For each input, you must set the 'Video Source' and 'Audio Source' settings according to the connection type. (see “Input Config.” on page EN-31)

**HDMI connectors**

PVR, UHD, BD, SAT, AV, GAME, STB

Connect the HDMI video outputs of your source equipment to these corresponding HDMI inputs.

**OUTPUT**

Connect this output to the HDMI video input of your display device. Output 1 is compatible with HDMI Enhanced Audio Return Channel (eARC). If you have a supported TV/Smart TV then sound from the television’s internal tuner or streaming platform (e.g. Roku, Netflix, Hulu) will be available using the Receiver's 'Display' input.

**Dante ports**

Dante is a licensed technology from Audinate®. It uses standard Internet Protocols over a 100Mb or Gigabit network and is capable of transporting professional-quality, low-latency audio. Dante runs on standard computer networking hardware and does not require dedicated network infrastructure; Ethernet switches transmit Dante digital media streams alongside ordinary data traffic. The physical Dante connections must be made using Category 5e or Category 6 cables 100m/328ft between devices when using a Gigabit network. The two Dante (RJ-45) ports on the back of the SDR-35 and SDP-55 can be used to transmit high-resolution digital audio to other Dante-enabled devices connected to the same network.

Dante is configured and controlled using the Dante Controller software which is a free download for Windows or mac OS which can be downloaded at www.audinate.com/products/software/dante-controller

Dante works independently of the unit control (via the Ethernet jack on the SDR-35 and SDP-55).

Be sure to use the Dante jacks only for Dante networking applications. For more information on Dante, please visit www.jblsynthesis.com
Digital audio connectors

SAT, PVR, BD, CD, STB, AV
Connect these inputs to the digital outputs of your available source equipment.

Zone 2 connectors

The Z2 out HDMI connector can be used to connect the output of the Receiver to a system located in a second room.

Analog preamplifier outputs

All preamplifier analog outputs are buffered, have a low output impedance, are at line level and follow the Zone 1 volume control setting. They are able to drive long cables or several inputs in parallel if required.
For more information on connecting speakers or additional power amplifiers, see pages EN-9 and EN-16.
The SDP-55 has XLR outputs in addition to the RCA (or unbalanced) pre-outs for connection to an external amplifier.

Analog audio inputs

STB, GAME, AV, BD, PVR, CD
Connect the left and right inputs to the left and right outputs of your source equipment.

Front panel AUX input

The front panel AUX input can be used as an analog input, using a stereo 3.5mm lead.

Front panel headphone jack

This socket accepts headphones with an impedance rating between 32Ω and 600Ω, fitted with a 3.5mm stereo jack plug. The headphone socket is always active, except when Receiver is muted.
When the headphone plug is inserted, the speaker outputs and analog preamplifier outputs are automatically muted.
Connection Guide

Blu-ray Disc (BD)/DVD player
The diagram shows how to make audio and video connections from a typical BD/DVD player. Whether HDMI, digital or analog connections are used, connecting using the input/inputs labelled BD on the Receiver will aid in operation.

Satellite receiver
A satellite receiver is connected with the same order of preference according to the outputs provided by the satellite receiver.

CD player
Connect the digital output to the digital CD input of the Receiver and analog output to the analog CD input of the Receiver, using a high quality interconnect cable.

NOTE: For each input, you must set the 'Audio Source' setting according to the connection type. (see “Input Config.” on page EN-31)
Radio & Wireless Audio Connectors

DAB/FM connector

The Receiver is fitted with an FM and a DAB/DAB+ receiver module. The type of aerial you need depends on your listening preferences and the local conditions.

Your Receiver is capable of superb radio reception, but only if it is receiving a good quality transmission signal.

Try the antennas supplied with your unit. If you are in a medium to strong signal area, these should be adequate for good reception. In areas with poor signal strength, you may require a roof or loft mounted aerial.

Contact your local JBL Synthesis dealer or aerial installation experts for advice about local reception conditions.

In Band III transmission areas (such as the UK), use a multi-element Yagi aerial with the elements mounted vertically, as the transmissions are vertically polarised. If you are close to more than one transmitter, use an omnidirectional or folded dipole aerial.

If the DAB services in your area are transmitted on L-band, then ask your dealer for advice for the best aerial to use.

Wi-Fi/Bluetooth

If using the Wi-Fi or Bluetooth features of the Receiver, please attach the single antenna for the Bluetooth and the two antennas for the Wi-Fi.

In strong signal areas, the DAB/FM ‘T’ wire antenna supplied can be used with reasonable results. Mount the antenna as high up as possible on a wall.

In the UK the ‘T’-elements need to be positioned vertically for DAB reception since broadcasts are vertically polarised. In other localities, check with your JBL Synthesis dealer or try both horizontal and vertical positions for best reception.

Try each usable wall of the room to see which gives best reception and use tacks or adhesive tape to secure the aerial in a ‘T’ shape, but note that no tacks should come into contact with the internal wire of the aerial.

When installed and receiving DAB/FM, check the signal strength by pressing the front panel or remote control’s INFO button until the signal quality indicator is displayed.

In weak signal areas, a high-gain, externally-mounted or roof-mounted antenna is desirable in order to receive the highest number of services.
Other Connectors

Serial connector
RS232 serial connector

The connector is used with control devices having an RS232 serial port (for example, Crestron and AMX touch-screen controllers).

Network connector
Networking is a large subject and only the briefest guidelines are presented in this handbook. Please consult your JBL Synthesis dealer or specialist installer for more information about introducing the Receiver into your computer network.

Ethernet
If an Ethernet cable is connected, the Receiver will automatically attempt to connect to your network. You should use a CAT5 or above cable plugged into the RJ45 socket labelled ETHERNET on the rear panel.
If your network uses static IP addressing rather than DHCP, you will need to provide an IP address, gateway and DNS address; see page EN-34 for information on setting up the network.

USB connector
The Receiver can be updated via the USB port on the rear of the unit, if no network connection is available for an “Over the air” update.

Trigger connectors

The trigger connectors TRIG Z1 and TRIG Z2 provide an electrical signal whenever the Receiver is switched on and the relevant zone enabled.
The trigger signal can be used to switch on and off compatible pieces of home entertainment equipment, for example, you could set up a trigger to turn on your television and BD player whenever the Receiver was switched on.
There are two trigger output sockets on the Receiver, each capable of outputting a 12V, 70mA switching signal. The socket is designed for mono 3.5mm jacks: tip is the trigger output, sleeve is ground.

TRIG Z1
Use for remotely turning on and off power amps or source equipment for Zone 1. On = 12V, Off = 0V.

TRIG Z2 (Not AVR10)
Use for remotely turning on and off power amps or source equipment for Zone 2. On = 12V, Off = 0V.

Infrared (IR) connectors

The infrared inputs Z1 IR and Z2 IR allow the connection of external IR receivers, either when the Receiver front panel IR receiver is fully or partially obstructed or to allow the use of a remote control in Zone 2.
There are two IR inputs on the Receiver, each designed for stereo or mono 3.5mm jacks. Tip is the modulated signal, sleeve is ground.

Z1 IR
This input is intended for use with an IR receiver when the front panel of the Receiver is blocked.

Z2 IR (Not AVR10)
This input is intended for use with an IR receiver in Zone 2 to allow remote control of Receiver from a second room.

NOTE: The IR inputs on the Receiver are designed for modulated signals. If the external IR receiver demodulates the IR signal, it will not work. Also, the unit does not provide power for external receivers on the IR jack, therefore an external power source will be required.

NOTE: Sockets referring to ‘Z2’ relate to connections used in multi-room installations. For more information on these connectors, see page EN-11.
Speakers

The SDR-35 and SDP-55 allow you to connect up to sixteen speakers. The SDP-55 needs additional power amplifiers to utilize all 16 channels. The SDR-35 and SDP-55 has 7 channels of amplification. 5 channels of amplification correspond to speakers installed in the front left, center, front right, surround left, surround right. The remaining 2 channels of amplification can be assigned as:

- bi-amp the front left and right
- surround back left and surround back right
- height 1 left and right
- Zone 2 left and right

Height front left, height front right, height back left, height back right and five more additional speakers can be attached using an additional power amplifier, see page EN-16 for more information.

With the addition of correctly installed and configured height channels, Dolby Atmos for the home, DTS:X or Auro 3D brings the ultimate cinema sound experience to your home theatre to create powerful, moving audio that flows around you.

The configuration and placement of your speakers is very important. All speakers, with the exception of the subwoofers, should be arranged around your normal viewing/listening position. The SDR-35 and SDP-55 decode Dolby, DTS, and Auro3D surround formats. Each has unique requirements for speaker placement. In addition the processors are equipped with Dirac Bass Management for multiple sub-woofers. The speaker placement and system calibration should be performed by a certified JBL Synthesis Dealer for optimum performance in all formats.

It is imperative that low frequencies are evenly distributed across all seating positions. This is best achieved using multiple sub-woofers. Best results are usually achieved by placing sub-woofers in all four corners of the room, performing precise measurements and making the proper adjustments to time, frequency and amplitude domains to minimize seat to seat variation and maximize performance for the unique physical characteristics of a particular room.

Certified JBL Synthesis Calibrators are equipped with the experience and tools to implement the best possible calibration for each room.

For more information on room calibration and sound field management visit www.jblsynthesis.com
Connecting Speakers

To connect each of the speakers, unscrew the corresponding terminals on the back of the Receiver, insert the speaker wires through the hole in each post and screw the terminals down. Make sure that the red (positive/) terminal of the speaker is connected to the red (positive/) terminal on the back panel, and the black (negative/-) terminal of the speaker is connected to the black (negative/-) terminal on the back panel.

It is important that no stray strands of wire from these connections are allowed to touch another cable or the back panel. Failure to ensure this can cause a short circuit and damage your Receiver.

Ensure the unit is switched off while connecting speakers. Do not over-tighten the loudspeaker terminals, or use a wrench, pliers, etc., as this could damage the terminals and this would not be covered under the product's warranty.

Speaker cables

The speakers should be connected to the amplifier using high-quality, copper cables. A heavy gauge (thick copper) and as short as practical is ideal. The gauge should be heavier (a lower number) for longer runs. Using speaker cables that are too long and/or thin gauge can significantly degrade the sound quality.

Connections to the speaker terminals should always be finger tight, whether using bare wires or spade connectors.

Bi-amping the Front Left & Front Right speakers

Bi-amping is the use of two amplifier channels per speaker. Bi-amping can provide better sound quality than conventional single wiring. If you do not have Surround Back speakers (i.e. you have a 5.1 surround system, or a 7.1 system) then you can use the spare Surround Back speaker outputs to bi-amp the front left and right speakers, if your speakers support bi-amping. The spare channels can alternatively be used to power stereo speakers in another room (Zone 2).

Speakers that support bi-amping have two sets of +/- terminals per speaker, usually linked together by metal strips. These metal strips MUST be removed when bi-amping, failure to remove them will result in damage to the amplifier that is not covered under warranty.

To bi-amp the front left and right speakers, remove the metal strips from the speaker terminals. Connect the woofer or LF terminals to the FL and FR terminals on the Receiver. Connect the tweeter or HF terminals to the SBL and SBR terminals on the Receiver. Finally, navigate to the Setup Menu ‘Spkr Types’ and set the ‘Use Channels 6+7 for’ menu option to ‘BiAmp L+R’, see page EN-32.

Using external power amplifiers

The internal power amplifier of the Receiver can be supplemented or replaced with external power amplification, such as the JBL Synthesis SDA-7120 or SDA-2200. Connect the PREAMP OUT sockets to your power amplifier inputs.

FL, FR
Connect these to the equivalent Right and Left front channels of your power amplifier.

C
Connect these to the Center front channel of your power amplifier.

SUB
Subwoofer outputs. Connect this to the input of your active subwoofer(s), if present.

SR, SL
Surround Right and Surround Left outputs. Connect these to the Surround Right and Left power amplifier inputs.

SB2, SBL
Surround Back Right and Surround Back Left outputs. Connect these to the Surround Back Right and Surround Back Left power amplifier inputs.

Height 1 (Height Front), Height 2 (Height Back)
Height Front and Height Back. Connect these to the Height channel power amplifier inputs.

All preamplifier analog outputs are buffered, have a low output impedance and are at line level. They are able to drive long cables or several inputs in parallel if required.
Operating your Receiver

For information display we recommend you use the OSD (On-Screen Display) on your display device whenever possible. For set up and configuration we recommend accessing the internal webpage using a tablet or computer, or using the front panel display.

For more information on accessing the internal set up page visit www.jblsynthesis.com.

Switching on

Press the front panel power button in. The power LED will glow white. When initialization is complete, the display shows the volume setting and the name of the selected input.

Please wait until the unit has finished initializing before operating the Receiver. It is recommended that if the unit is switched off, you should wait at least 10 seconds before switching the unit back on.

Standby

The Receiver has a standby mode which can be entered by pressing STANDBY on the remote control. When in standby mode, the display is blank and the POWER LED glows red.

If the unit is to be left unused for an extended period, we recommend that you disconnect it from AC power to save power.

To switch on from standby

Press the STANDBY button on the remote control, any key on the front panel (other than the power button) or rotate the volume knob.

Front panel display

The Receiver is ready for use after about four seconds. The display window shows the currently selected source and the last selected information view setting (this information line can be changed using the INFO button).

The current volume setting for Zone 1 is displayed on the front panel. The volume setting for Zone 2 is displayed temporarily whenever it is adjusted.

The front panel display is also used for unit setup after pressing the MENU key on the front panel or remote.

Selecting a source

To select a particular source, press the INPUT of INPUT 1 buttons until that source is shown on the front panel display, or (if available) press the corresponding source button on the remote. The following sources are available:

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STB</td>
<td>Set Top Box input</td>
</tr>
<tr>
<td>GAME</td>
<td>Game console input</td>
</tr>
<tr>
<td>AV</td>
<td>Audio-Visual input</td>
</tr>
<tr>
<td>SAT</td>
<td>Satellite input</td>
</tr>
<tr>
<td>BD</td>
<td>Blu-ray Disc/DVD player input</td>
</tr>
<tr>
<td>UHD</td>
<td>UHD player input</td>
</tr>
<tr>
<td>PVR</td>
<td>Personal Video Recorder input</td>
</tr>
<tr>
<td>CD</td>
<td>Compact Disc player input</td>
</tr>
<tr>
<td>FM</td>
<td>Internal tuner input</td>
</tr>
<tr>
<td>DAB</td>
<td>Internal tuner input (this source is market dependent and may not be available on your Receiver)</td>
</tr>
<tr>
<td>NET</td>
<td>Ethernet input</td>
</tr>
<tr>
<td>USB</td>
<td>External USB solid-state device (e.g. pen drive) input</td>
</tr>
<tr>
<td>AUX</td>
<td>Auxiliary (front panel) input</td>
</tr>
<tr>
<td>DISPLAY</td>
<td>The Audio Return Channel (eARC) from a compliant display. Use this with a compliant television using internal TV tuners</td>
</tr>
</tbody>
</table>

Most audio inputs have both analog and digital connections. You must specify the type of connection used for each input using the Audio Source option in the ‘Input Config.’ menu, see page EN-31. Note that an incorrect setting will result in no sound — the default for inputs with HDMI is HDMI audio. If you are not using HDMI audio then this setting must be changed. For inputs that do not have HDMI, the default is digital audio.

The processing mode and Stereo Direct functions are remembered and recalled for each individual input.

Stereo Direct

To listen to a pure analog stereo input, press the DIRECT button. The Stereo Direct mode automatically bypasses all processing and any surround functions. In direct mode, digital processing including Dirac room eq, is shut down if desired. Digital noise within the processor will be reduced to an absolute minimum.

NOTE: When Stereo Direct mode is selected, no bass management is performed, meaning that bass signals will not be redirected to a subwoofer.

Volume control

It is important to realize that the level of the volume indicator is not an accurate indication of the power delivered to your loudspeakers. The Receiver often delivers its full output power long before the volume control reaches its maximum position, particularly when listening to heavily recorded music. In comparison, some movie sound tracks can appear very quiet, as many directors like to keep maximum levels in reserve for special effects sequences.

Headphones

To use headphones with the Receiver, plug the headphones into the PHONES jack in the center of the front panel.

When headphones are plugged into the front panel PHONES socket, the outputs for Zone 1 are muted and the audio will be down-mixed to two channels (2.0). The two-channel down-mix is required so that the center channel and surround information can be heard via the headphones.
Extended front panel menu

Pressing the **menu** key on the front panel and holding it for longer than four seconds will bring up the Extended Menu, allowing you to perform the following:

**Restore to factory defaults**
This option allows you to restore all settings on your Receiver to the defaults from which it left the factory.

**Check for update**
Checks for an over-the-air firmware update (requires external network connection).

**Restore secure backup**
This option allows you to restore all settings to their state as saved using the 'Store secure backup' feature. This option is useful if settings are accidentally changed.

**Store secure backup**
This option allows you to save all the Receiver settings to a secure area of memory. The settings can be retrieved using the Restore option above.

**Restore USB backup**
This option allows you to restore all the settings from a file previously saved on a USB flash drive.

**Store USB backup**
This option allows you to save all the settings to a USB flash drive.

**Region**
Sets the region you are located - Europe, (RoW) US or Canada.

**Change remote code**
The default RCS system code the Receiver responds to is 16. If required, for example due to another device in your system also using this RCS system code, it can be changed to 19. The supplied remote can also be reprogrammed to use RCS system code 19 commands, see page EN-22.

**Standby mode**
"Auto" uses the power-saving auto-standby feature, which will cause the unit to go into standby after 20 minutes if no signal is present or user input occurs, "manual" allows the user full control of when the unit goes into standby.

**Protection sensitivity**
This option allows adjustment of the protection sensitivity of the power amplifier (not SDP-55). Caution should be used with this setting as it is deliberately configured for maximum protection and should only be adjusted when using speakers that are "complex loads"!

**Use display HDMI**
If set to "no" the Receiver will ignore the EDID of the display and send all resolutions from the source through the Receiver.

**Display type**
Adjusts the position of the OSD depending on if a 16:9 & 21:9 display is being used.

**Updating firmware via USB**
The firmware in your Receiver can be updated from a USB flash drive containing firmware update files.
You can download the latest firmware file, together with upgrading instructions, from the JBL Synthesis website ([www.jblsynthesis.com](http://www.jblsynthesis.com)).
Front Panel Operation

DIRECT
Stereo Direct on/off. Provides a direct analog path from the analog inputs to the left and right front outputs. Switches off any surround processing modes and shuts down the DSP circuits.

MUTE
Mutes all analog audio outputs in the currently selected zone.

MENU
Selects the Setup menus.

OK
Used to enter selections made in the Setup menu.

INPUT
These buttons select the source connected to the corresponding input (or internal input). Unused sources can be prevented from being selected in the setup menu by blanking the name in MENU > Input Config.

PHONES
This socket accepts headphones with an impedance rating between 32Ω and 600Ω, fitted with a 3.5mm stereo jack plug.

AUX
Auxiliary line level input.

DISPLAY
This switches the display brightness between off/dim/bright.

MODE
Selects between Stereo and the available surround modes for the current source.

ZONE
Selects between Zone 1 and Zone 2 control.

INFO
Selects the information displayed on the lower left portion of the front panel.

POWER/STANDBY LED
This indicates the status of the receiver and is blue when the Receiver is powered on. Red indicates the unit is in Standby mode.

POWER
Switches the main power to the Receiver on and off. Once the unit is switched off, it should be left for at least ten seconds before switching on again.

INFO
Selects the information displayed on the lower left portion of the front panel.

VOLUME
Adjusts the analog output volume in the selected zone (line out, speakers and headphones).

REMOTE CONTROL RECEIVER
This is positioned behind the display window, on the front panel. Ensure the receiver is in a clear line of sight from the remote control for operation. If this is not possible, use a separate sensor connected to the Z1 IR input on the rear panel.
Remote Control

The universal remote controller
The Receiver is supplied with a sophisticated ‘universal’
backlit remote control that can control up to eight devices.
It is pre-programmed for use with the Receiver and many
other Harman products (FM/DAB tuners, CD players and
BD players).

With its extensive built-in library of codes, it can also be used
with thousands of third party audio-visual components –
TVs, satellite and set-top boxes, PVRs, CD players, etc. See the
list of codes at the back of this handbook.

It is also a ‘learning’ remote, so you can teach it almost any
function from an old single-device remote.

Using the remote control
Please keep in mind the following when using the remote
control:

☐ Ensure there are no obstacles between the remote
control and the remote sensor on the Receiver. The
remote has a range of about 25 feet. (If the remote
sensor is obscured, the Z1 IR remote control input
jack on the rear panel is available. Please consult your
dealer for further information.)

☐ Remote operation may become unreliable if strong
sunlight or fluorescent light is shining on the remote
sensor of the Receiver.

☐ Replace the batteries when you notice a reduction in
the operating range of the remote control.

Inserting batteries into the remote control
1. Open the battery compartment on the back of the
handset. To do this, press the catch on the battery
cover as indicated by the arrow on the catch and
remove the battery cover.
2. Insert two ‘AAA’ batteries, as indicated in the
battery compartment.
3. Replace the battery cover. To do this, locate the lug on
the battery cover into the corresponding hole on the
short edge of the battery compartment. Now press
the opposite end of the battery cover (with the catch)
down so that the cover is flush with the main body of
the remote and the catch clicks.

Notes on batteries:
☐ Incorrect use of batteries can result in hazards such as
leakage and bursting.
☐ Do not mix old and new batteries together.
☐ Do not use non-identical batteries together – although
they may look similar, different batteries may have
different voltages.
☐ Ensure the plus (+) and minus (-) ends of each battery
match the direction indicated in the battery compartment.
☐ Remove batteries from equipment that is not going to be
used for a month or more.
☐ When disposing of used batteries, please comply with
governmental or local regulations that apply in your
country or area.

Useful information

Backlight
A backlight comes on for eight seconds whenever a key
is pressed. This helps you use the handset in subdued
lighting conditions.

LED blinks
Short blinks indicate a valid key press.
Multiple short blinks convey information (such as a device
code) or signal the beginning and successful completion of
a programming sequence.
The symbol ‘*’ is used in the manual to indicate an LED
blink.

Timeouts and unassigned keys

Timeout – After 30 seconds the remote exits the
programming state and returns to normal operation.

Stuck key timeout – After any key is pressed continuously
for 30 seconds, the remote stops sending IR transmission to
conserve battery life. The remote remains off until all keys are
released.

Unassigned keys – The remote ignores any unassigned
key presses for a particular Device Mode and does not
transmit IR.

Low voltage indicator
When the batteries are running down, the backlight flashes
briefly whenever you press a button. If this happens, fit two
new AAA alkaline batteries as soon as possible.
Device Mode/Source keys
As the remote can control your Receiver as well as a range of other equipment, many of the buttons have more than one function depending on the "device mode" selected on the remote control.

The Device Mode keys (shown below) select the source on the Receiver. If one of these keys is pressed briefly, a command is transmitted to change the source on the unit. Also the functionality of the remote control changes to operate the selected source device; it’s like having a bundle of different remotes in your hand.

<table>

</tbody>
</table>

Each Device Mode changes the behaviour of many of the remote keys to control the source device appropriately. For example: in **CD** mode **9** plays the previous CD track, but in **AV** mode **H** issues the TV "channel down" command.

The remote remains in the last selected Device Mode so it is not necessary to press a Device Mode key before every command key if all you are doing is playing or skipping tracks on a CD, for example.

Navigation keys
The Navigation keys steer the cursor in Setup menus or on-screen menus. They also replicate the navigation functions of original remotes supplied with other home entertainment devices in your system. **OK** confirms a setting.

Volume control
By default, the remote is set up so that the volume control and mute buttons always control the volume of the Receiver, regardless of which Device Mode the remote is currently set for. This is known as volume ‘punch through’.

For example, if you are listening to a CD, you will probably have the remote in **CD** Device Mode to control the CD player. You can use the volume controls on the remote directly to adjust the volume of the Receiver without first having to press **AMP** to put the remote into **AMP** Device Mode. The volume buttons ‘punch through’ the **CD** Device Mode on the remote to the **AMP** Device Mode.

Volume ‘punch through’ can be disabled individually for any Device Mode if desired.

Customising the remote
The remote offers a Code Learning feature that allows you to copy up to 16 functions from an original remote control onto the remote keypad. For details of this, and other customisation features, see "Customising the Remote" on page EN-22.

The remote complies with Part 15 of the FCC rules
This equipment has been tested and found to comply with the limits for a class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide a reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

Reorient or relocate the receiving antenna.
Increase the separation between the equipment and receiver.
Connect the equipment into an outlet or a circuit different from that to which the receiver is connected.
Consult the dealer or an experienced radio/TV technician for help.
Customizing the Remote

Code learning
The supplied remote comes with a complete library of pre-programmed codes. After you have set up the remote for your device, you may find that there are one or more functions on your original remote which do not have a place on the keypad. For convenience, the remote offers a Code Learning feature that allows you to copy up to 16 functions from an original remote control onto the remote keypad.

Before you start, make sure that:

- The original remote control is working correctly.
- The remotes are not pointing at your device.
- The remotes have fresh batteries.
- The remotes are not in direct sunlight or under strong fluorescent lights.

NOTE: Learned functions are mode-dependent. You could assign up to eight different functions to a single key – a separate learned function for each mode.

Direct code setup (Method 1)
The first method is to program the remote with the 3-digit code number for the device you wish to control – see “device code tables”. Make a note of the suggested number or numbers – the most popular code is listed first. Now power on the device.

1. Press the Device key for the product you want to set up, together with the key. Hold down both buttons for three seconds until the LED stays lit.

You are now in setup mode, and you can release the buttons.

2. Enter a 3-digit code for the device.

   - If the 3-digit code number you entered is correct for the device, it will turn off. If it doesn’t turn off, enter the next code number from your list until the device does turn off.

3. Once you have found the correct code, press the Device key again. The LED blinks three times ** to confirm that the code has been successfully stored.

Learning setup (Method 3)
The third method involves ‘teaching’ the JBL Synthesis remote from the original remote for the device. The two remotes should be facing each other, about 4 inches (10cm) apart.

1. Press the Device key for the product you want to set up, together with the key. Hold down both buttons for three seconds until the LED stays lit.

2. Press the button on the JBL Synthesis remote that you want to assign a command to. The LED blinks once ** indicating that the remote is ready to learn the command.

3. Press and hold down the appropriate key on the other remote until the LED blinks twice **. This indicates the JBL Synthesis remote has learned the command from your other remote.

4. Continue learning the commands from your other remote by pressing the next button on the remote and repeating steps 2 and 3.

5. Once the remote has learned all the selected commands, press and hold the Device key you used to enter learning together with the Numeric 3 key to store the learned commands.

NOTE: If the JBL Synthesis remote LED blinks five times ** there was an error in the learning process. In this case, please start the Learning Setup from the start.

The AMP and RADIO keys do not learn commands.

Important notes

- Once you start a Code Learning session, you have approximately ten seconds to conduct each step. Any longer, and a timeout means that you'll have to start the process again.
- The Learning feature is mode-specific – you can copy one feature per mode onto a key.
- The remote can learn approximately 16 functions in total.
- To replace a learned function, simply assign a new function to the same key.
- Learned functions are retained when you change batteries.
- If Code Learning fails, try altering the distance between the two remotes; make sure that the ambient light is not too bright.

Deleting the learned data

To delete all the learned data for a device:

1. Press the Device key for the product you want to set up, together with the key. Hold down both buttons for three seconds until the LED stays lit.

2. Press and hold down the Device key for the product that you want to erase, together with the key for three seconds until the LED blinks twice **.

3. If no further key presses are made for 30 seconds after the LED blinks twice **, the remote leaves erase mode without deleting the learned data.

4. If you press the Device key together with the key one more time within 30 seconds after LED blinks twice **, you can finish the erase mode deleting all the data learned on the Device. The LED blinks three times ** to confirm.

NOTE: On the following pages, a single ‘blink’ of the remote’s power LED is indicated by the symbol **.
To delete the learned data for a key for a device:

1. Press the Device key for the product you want to set up, together with the 3 key. Hold down both buttons for three seconds until the LED stays lit.
2. Press and hold down the key on which you want to delete the data for three seconds. The LED blinks twice. If any further key press is made, the remote escapes from erase mode without deleting the learned data.
3. If any further key press is not made for 30 seconds, the LED blinks twice, the remote escapes from the erase mode automatically without deleting the learned data.
4. If you press the Device key together with the 3 key again within 30 seconds after the LED blinks twice, all the data learned for that Device is deleted and you leave erase mode. The LED blinks three times in confirmation.

Reading stored code numbers

1. Press the Device key for the product that you want to set up together with the 4 key. Hold down both keys for three seconds until the LED lights.
2. Press the INFO key and count the number of blinks (1=1, 2=2, 3=3, etc.). There is a time gap between digits. (Note that '0' is represented by ten blinks: 1111111111).

Locking/unlocking a specific Device Mode

When you first unpack your remote and insert the batteries, it is able to control certain JBL Synthesis components automatically (e.g. BD players, Amplifiers, Tuners and CD Players). We achieve this by programming specific JBL Synthesis device codes onto the relevant Device Mode keys, then locking the Device Modes so you don’t reprogram them inadvertently.

If you want to override these locked default settings – to control a third-party BD player, for example – you will first need to unlock BD Mode before setting up the remote using one of the learning methods described on the previous page.

Here are the factory default settings:

<table>
<thead>
<tr>
<th>Device Mode</th>
<th>Default status</th>
<th>Default codes</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP</td>
<td>Locked</td>
<td>001 (JBL Synthesis code 16)</td>
</tr>
<tr>
<td>BD</td>
<td>Locked</td>
<td>001 (JBL Synthesis)</td>
</tr>
<tr>
<td>AV</td>
<td>Unlocked</td>
<td>108 (Philips TV)</td>
</tr>
<tr>
<td>UHD</td>
<td>Unlocked</td>
<td>Code learning only</td>
</tr>
<tr>
<td>GAME</td>
<td>Unlocked</td>
<td>Code learning only</td>
</tr>
<tr>
<td>STB</td>
<td>Unlocked</td>
<td>030 (Bush/Goodmans/ Grundig, from SAT database)</td>
</tr>
<tr>
<td>SAT</td>
<td>Unlocked</td>
<td>128 (Sky+ Digital, from SAT database)</td>
</tr>
<tr>
<td>PVR</td>
<td>Unlocked</td>
<td>018 (Humax PVR, from SAT database)</td>
</tr>
<tr>
<td>CD</td>
<td>Locked</td>
<td>001 (JBL Synthesis)</td>
</tr>
</tbody>
</table>

Alternative codes are available for multi-room solutions, or in the case of code clashes with other manufacturer’s products. For example:

AMP (system code 19): 002

Note that you need to change the system code on the product you wish to control, as well as the remote.

1. AMP BD and CD are the Device keys that may be Locked or Unlocked.
2. AMP + OK sends a Power Off command
3. AMP + OK sends a Zone command
4. AMP + OK cycles through HDMI outputs 1, 2, 1 & 2
5. CD + OK sends a Power On command
6. CD + OK sends a Power Off command
7. BD + OK sends a Power On command
8. BD + OK sends a Power Off command
9. BD + OK sends a Resolution command

Factory default reset

You can reset your remote to the original factory default settings.

Press and hold both the (home) and MENU keys for about five seconds until the power LED blinks five times.

All programming and setup codes that you have entered into the remote are erased and the remote returns to the original factory default settings.

Device codes

The tables that are in the final section of this Handbook list 3-figure codes for different manufacturers’ devices. Use these when setting your remote up to control your devices, as described in Direct code setup: Method 1 (see previous page).

If more than one code number is listed, try the first number. If the results are unsatisfactory, continue trying the numbers for that manufacturer to get the best ‘fit’ with the functionality required.

If the manufacturer of your equipment is not listed, you can try Library search setup: Method 2 (see previous page). This method allows you to scan through every code contained in the remote’s memory.

Hidden commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP + (home)</td>
<td>Sends a Power On command</td>
</tr>
<tr>
<td>AMP + MENU</td>
<td>Sends a Power Off command</td>
</tr>
<tr>
<td>AMP + OK</td>
<td>Sends a Zone command</td>
</tr>
<tr>
<td>AMP + OK</td>
<td>Cycles through HDMI outputs 1, 2, 1 &amp; 2</td>
</tr>
<tr>
<td>CD + OK</td>
<td>Sends a Power On command</td>
</tr>
<tr>
<td>CD + OK</td>
<td>Sends a Power Off command</td>
</tr>
<tr>
<td>BD + OK</td>
<td>Sends a Power On command</td>
</tr>
<tr>
<td>BD + OK</td>
<td>Sends a Power Off command</td>
</tr>
<tr>
<td>BD + OK</td>
<td>Sends a Resolution command</td>
</tr>
</tbody>
</table>

Controlling the volume of other devices

By default, the volume keys and mute key control the amplifier volume. You can configure these buttons so they send volume commands to another device. In the following example, the volume commands are sent to a linked AV device (your television, for instance):
1. Press AV + 5 for three seconds, until the LED lights and stays on.
2. Press VOL UP.
3. Press AV again. The LED blinks three times.
4. The volume and mute keys will now send the volume commands to the TV.
5. To set the volume buttons to control the amplifier once more, repeat the above steps, except press AMP in step 3.
**AMP Device Mode**

The **AMP** Device Mode button configures the remote to control the Receiver. Pressing this button does not affect the currently selected input on the Receiver.

The functionality of the remote is context sensitive for the internal sources and is described in the following table.

| **Single press** | Toggles Receiver power between standby and on in the current zone (where the command is received). |
| **Press and hold** | Forces all zones into standby, regardless of which zone the command was received in. |
| **0...9** | The number keys can be used for direct entry of numeric values. |

**SYNC**

Sync. Delays may be introduced into the video signal by video processing which causes a mismatch between the audio and video timing. You will notice this by speech sound being out of synchronization with the lip movements in the video. To compensate for this, you can adjust the lip sync delay. Press the **SYNC** button and use the **<** and **>** navigation buttons. Press again to exit the lip sync trim menu.

**INFO**

Info cycles through the information displayed on the lower left portion of the front panel display when on **TUNE** and **USB** inputs.

**MNT**

Displays the unit’s setup menu on the On Screen Display.

**PFS UP**

Toggles Dolby Volume on/off

**AMP**

Resets remote to **AMP** mode.

**DIRECT**

Stereo direct on/off. Provides a direct analog path from the analog inputs to the left and right front outputs. Switches off any surround processing modes and shuts down the DSP circuits.

**RTN**

Brings up a temporary subwoofer trim control. Use the **<** and **>** navigation buttons. Press **RTN** again to exit the sub trim control. As this is a temporary adjustment, the sub trim level is reset to the value set in the Speaker Levels menu when the unit is turned off or put into standby.

**K**

Toggles the mute function of the AVR.

**VOL**

Adjust amplifier volume.

**MIX**

Cycles through the available surround and downmix modes.

**DSP**

Cycles through the front panel display’s brightness options.

**AMP**

Brings up the DTS:X dialog control adjustment.

**OK**

selects the highlighted file or enters the highlighted menu on the screen – equivalent to ‘Enter’ or ‘Select’ on some remote controls.

- **Up**
- **Left**
- **Right**
- **Down**

**AMP <** Power on from standby

**AMP >** Standby from Power on

**AMP OK** select Zone 2

**NAV**

Navigate the files and menus on the screen. **OK** selects the highlighted file or enters the highlighted menu on the screen – equivalent to ‘Enter’ or ‘Select’ on some remote controls.

| **RED** | Red button. |
| **GREEN** | Green button. |
| **YELLOW** | Yellow button. |
| **BLUE** | Blue button. |
| **RADIO** | Tuner input. |
| **AUX** | Aux input. |
| **AV** | AV input. |
| **STB** | STB input. |
| **BD** | BD input. |
| **CD** | CD input. |
| **STB** | STB input. |
| **UHD** | UHD input. |

**Network commands**

When using the network client, the keys below are used to navigate music files in **AMP** Device Mode.

- **SELECTS** selects/plays the highlighted file.
- **◄ ►** Pauses and plays back of the current track.
- **-II** Stops playback.
- **DB** Adds the currently displayed radio station to the favourites list when using the network client.
- **GREEN** Removes the currently displayed radio station to the favourites list when using the network client.
- **OK** Returns navigation to the top level of the network client menus (‘Home’).
### BD/DVD Device Mode

The **BD** Device Mode button configures the remote to control the functions of Harman Blu-ray Disc and DVD players, although this can be changed. Pressing this button also selects **BD** as the source.

### UHD Device Mode

The **UHD** Device Mode button selects **UHD** as the source. The UHD page allows code learning from a dedicated UHD remote – see “Customising the Remote” on page EN-22.
**STB Device Mode**

The **STB** Device Mode button selects **STB** as the source. If configured to work with your set top box decoder or similar device, the remote can subsequently control the device.

- **Toggles power between standby and on.**
- **0-9** Functions as original remote number key – usually for channel selection.
- **INFO** Displays INFO or OSD (On Screen Display) function, if available.
- **MODE** Selects the Library or Media function.
- **Rew.** Fast Forward.
- **|>|** Channel down.
- **|<|** Channel up.
- **Stop playback.**
- **Pause playback of the current track.**
- **INFO** Opens the EPG (Electronic Program Guide) on some satellite and cable set top boxes.
- **INFO** Turns on the Menu function if the PVR uses this feature.
- **OK** Navigates setup and program selection menus. **OK** confirms a selection (equivalent to 'Enter' or 'Select' on some remotes).
- **INFO** Returns navigation to the top level of the menu ('Home').
- **INFO** Displays program information.
- **AMP** Resets remote to AMP mode.
- **RED** **RED** button for set top box.
- **GREEN** **GREEN** button for set top box.
- **YELLOW** **YELLOW** button for set top box.
- **BLUE** **BLUE** button for set top box.

**SAT Device Mode**

The **SAT** Device Mode button selects **SAT** as the source. If configured to work with your satellite receiver, the remote can subsequently control the device.

- **Toggles power between standby and on.**
- **0-9** Functions as original remote number key – usually for channel selection.
- **INFO** Displays INFO or OSD (On Screen Display) function, if available.
- **Channel down.**
- **Channel up.**
- **INFO** Displays program information.
- **OK** Navigates setup and program selection menus. **OK** confirms a selection (equivalent to 'Enter' or 'Select' on some remotes).
- **INFO** Returns navigation to the top level of the menu ('Home').
- **RTN** Back.
- **AMP** Resets remote to AMP mode.
- **RED** **RED** button for set top box.
- **GREEN** **GREEN** button for set top box.
- **YELLOW** **YELLOW** button for set top box.
- **BLUE** **BLUE** button for set top box.

**PVR Device Mode**

The **PVR** Device Mode button selects **PVR** as the source. If configured to work with your personal (hard disc) video recorder or similar device, the remote can subsequently control the device.

- **Toggles power between standby and on.**
- **0-9** Functions as original remote number key – usually for channel selection.
- **INFO** Displays INFO or OSD (On Screen Display) function, if available.
- **Channel down.**
- **Channel up.**
- **INFO** Displays program information.
- **OK** Navigates setup and program selection menus. **OK** confirms a selection (equivalent to 'Enter' or 'Select' on some remotes).
- **INFO** Returns navigation to the top level of the menu ('Home').
- **RTN** Back.
- **AMP** Resets remote to AMP mode.
- **RED** **RED** button for set top box.
- **GREEN** **GREEN** button for set top box.
- **YELLOW** **YELLOW** button for set top box.
- **BLUE** **BLUE** button for set top box.
### CD Device Mode

The **CD** Device Mode button selects **CD** as the source.

The button is configured to control the CD functions of JBL Synthesis CD players, although this can be changed (see "Locking/Unlocking a specific Device Mode" on page EN-23).

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open/close disc tray.</td>
<td><strong>O</strong> Toggles power between standby and on.</td>
</tr>
<tr>
<td>Searches for and plays the track corresponding to the key pressed.</td>
<td><strong>5-3</strong></td>

</tr>
</tbody>
</table>

In normal play (i.e. the display does not show the letter P), press the **A** and **C** keys to select the track and then **MENU** stores the track. In 'program play' mode, the **MENU** key deletes the stored track.

Navigate setup and CD program selection menus.

- **OK** selects the highlighted file or enters the highlighted menu on the screen – equivalent to ‘Enter’ or ‘Select’ on some remote controls.
- **Up**
- **Left**
- **Right**
- **Down**

- **CD** + **Power on from Standby**
- **CD** + **Standby from Power on**

**AMP** Resets remote to **AMP** mode.

**MUTE** Plays the programmed tracks.
Essential Setup

Before you use your Receiver it is essential that you enter some information into the Setup menus about your speaker configuration. This allows the Receiver to process any surround sound digital source to exactly match your system and give you the ultimate surround sound experience.

There are three pieces of vital information which are outlined in the sections: 'Speaker Types', 'Speaker Distances' and 'Speaker Levels'.

The way you enter this information manually into the Receiver is given later in the 'Setup Menus' section on page EN-30.

When calibrated using Dirac Live room equalization the speaker levels and delays will be established automatically and applied when the equalization is turned on, speaker types however must be manually entered. For use with equalization turned off, the speaker size, speaker distance and speaker levels settings must be entered manually. It is important to understand why these speaker settings must be entered, which is why this section is presented before the section on equalization.

Speaker types
You need to set the type of speakers that you have connected to your Receiver:

- **Large**: capable of full frequency range reproduction
- **Small**: not capable of full frequency range reproduction at the low frequency end
- **None**: speaker not present in your configuration

The terms 'Large' and 'Small' do not necessarily relate to the physical size of your speakers. As a rule of thumb, if a speaker cannot reproduce a flat frequency response down to about 40Hz (and very few can!) it is often better to consider them as 'Small' for setup purposes of home cinema.

When a speaker is set to 'Small', very low frequency sounds are redirected away from that speaker to a 'Large' speaker or a subwoofer, which are far better suited to reproducing these low frequency sounds. Many prefer to set even very full-range speakers to 'Small' to optimize the dynamic range of the system and to more fully utilize the Dirac Live Bass Management room EQ.

Note that it is not possible to set all speakers to 'Small' unless there is a subwoofer in your speaker configuration. If you do not have a subwoofer, you will be forced to set your front speakers to 'Large'. Some users may wish to automatically override the 'Small' speaker setting for purely stereo music listening when not watching movies. This can be achieved in the 'Input Config.' menu – see page EN-31.

Crossover frequency
If you have set any speakers as being 'Small', then you will be required to set a value for the crossover frequency. This is the frequency below which signals are filtered away from these Small speakers and redirected to 'Large' speakers or the subwoofer (if present). 80Hz is usually the best crossover frequency, since it sends non-directional low frequencies to the subwoofers which are best-suited to handle low frequencies and can be placed optimally to reproduce only the lowest frequencies.

A Certified JBL Synthesis Calibrator will select the appropriate settings during the calibration process. Use Channels 6+7 for

If not used in the main zone, it is possible to assign the Surround Back channels to Height 1, bi-amp the Front Left/Right channels or to provide an amplified output to Zone 2.

Note that the channels which are set to 'Small' will not have a subwoofer and therefore cannot reproduce low frequencies. Therefore, it is essential to ensure that the crossover frequency is set correctly to avoid low frequency signals being sent to a 'Small' speaker which cannot reproduce them.

Finally, the levels of all the speakers in the system need to be adjusted to match each other at the listening position, to create a proper surround sound effect. To help with this the Receiver can generate a test noise for each speaker which should be measured with a sound pressure level (SPL) meter. The meter should be set to 'C' weighting and slow response. Several smartphone/tablet apps are available which can also perform this function. The level of noise measured at the listening position from each speaker should be adjusted on the Speaker Trims page of the Setup menu so that the meter reads 75dB SPL. It does not matter what the system volume setting of the Receiver is before turning the test noise on as the volume setting is over-ridden for the duration of the speaker noise test.

NOTE: Mobile phone apps are limited in accuracy unless an external microphone is used. Consult your dealer for recommendations.

Speaker Levels

When calibrated using Dirac Live room equalization the speaker levels are adjusted to match the listening position. This allows the Receiver to process any surround sound digital source to exactly match your system and give you the ultimate surround sound experience.

Speaker Distances

It is essential for the distance from each speaker to the listening position to be accurately measured and entered into the 'Setup' menu. This ensures that the sounds from the various speakers arrive at the listening position at the correct time to recreate a realistic surround effect. The distance can be entered in centimeters or inches.
Auto Speaker Setup

Dirac Live with Bass Management

There is a proprietary automatic loudspeaker calibration function built into your Receiver from Dirac Research. Using a PC/MAC based application, this attempts to set the essential speaker settings for all the speakers in your system. It also calculates room equalization (Room EQ) filter values to remove some of the worst effects of resonant frequencies in the listening room.

Your Receiver package is supplied with a basic calibration microphone, which should be inserted into a USB port on a PC or MAC connected to the same network as the Receiver and positioned as directed by the Dirac Live PC/MAC application. This microphone picks up the special calibration tones generated by the speakers when Dirac Live application is run. Optionally, a high quality, calibrated third-party microphone can be used for greater accuracy, such as the miniDSP UMIK-1. The Receiver then analyzes the signal and computes:

- speaker delays,
- speaker level,
- problem resonant frequencies in the room which need control by filtering.

To help the system be as accurate as possible when performing Dirac Live setup, there are a few guidance rules that should be followed:

- Minimize any background sounds in the listening room and other nearby rooms.
- Close all windows and doors in the listening room.
- Turn off all fans including air-conditioning systems.
- Mount the microphone on a tripod or similar.
- Position the set up microphone pointing upwards at roughly head height when placed in the normal listening position. It is not necessary to point the microphone directly at the speaker generating the test tone, the microphone should be pointing vertically towards the ceiling. (It helps if you are able to position the microphone exactly where your head would normally be for listening, with the microphone in direct unobstructed view of all speakers.) Assure all objects, such as chair backs are at least 18 inches (46cm) away from the microphone. Ideally, move the seating away during measurements to prevent reflections that can reduce the accuracy of the equalization.
- If your system includes an active subwoofer, start by setting its output level/gain control to a value roughly matching the front speakers.

Although Dirac is designed to make the calibration process easier, a certified JBL Synthesis Calibrator has the training and tools to maximize performance results.

Problems

We advise you to look over the reported measurements on the screen following Dirac Live setup for any obviously incorrect results, in particular to ensure the reported speakers match your configuration and that the speaker distances to the listening position appear look roughly correct. If the results are not what you expected re-run Dirac Live setup.

The Dirac Live setup function is normally quite accurate but occasionally false results can be generated. Problems may be as a result of:

- external sounds or rumbling/handling noises picked up by the microphone
- sound reflections off hard surfaces (e.g. windows or walls) close to the listening position,
- very strong acoustic resonances within the room,
- obstacles (such as a sofa) between speakers and the microphone.

If you are still experiencing difficulties or you wish to have the most accurate results for ultimate surround performance, we recommend using the manual method of establishing speaker distances and levels.

Using subwoofers

If your system includes active subwoofers you may need to set the subwoofer output level/gain control set to a higher or lower value.

Please refer to the Dirac application and quick start guide for full details of how to use the system with your Receiver.

Downloading the Dirac Live application

To download the Dirac Live PC/MAC application and quick start guide, please visit: live.dirac.com

Using Dirac

You can store up to three Dirac EQ curves in the Receiver. Each input can use a different curve, for example a “Movie” curve on the BD input and “Music” curve on the CD input.

This can be set on a per input basis using the AUDIO key on the remote.

Alternatively use the Room EQ menu item in the Audio settings menu to set the curve for each input. See “Room EQ” on page EN-31.

NOTE: When Dirac is run for the first time the curve will be applied to all inputs. Subsequent curves will not be automatically applied; use the methods above to choose the required curve for the input in question.
The Setup menus allow you to configure all aspects of your Receiver. The next few pages will go through the menu items accessible via the front panel, IR remote, or internal web page and explain their function. The majority of the Setup menus need only be configured once when you first install the system (or if your system changes, you move any large furniture or the listening locations, or you move).

**Entering Setup mode**
To enter the setup menu, press the **MENU** button on the remote control or front panel. The front panel display shows the setup menu (pictured right).

**Navigating the setup menu**

**...using the remote control**
The setup menu can be navigated by using the cursor (arrow) keys on the remote control. This is by far the easiest method.

1. To enter the setup menu, press the **MENU** button (which is located immediately under the navigation buttons).
2. Use the **<** and **>** keys to navigate up and down the main section headings.
3. Once you have the main section that you require highlighted, use the **>** key to enter the section.

4. Use the **<** and **>** keys to navigate up and down the section settings in the right-hand panel. Some settings may be greyed out. These are either for information only (e.g. incoming sampling frequency) or are not currently selectable. Scroll bars on the sides of the right hand panel indicate your position in the settings list where there are more items than can be displayed at once.
5. Pressing **OK** selects a setting to change it, pressing **OK** again de-selects the setting.
6. At any time, press the **MENU** button to exit the menu. Any changes to settings are saved.

**...using the keys on the front panel**
The Receiver front panel controls can be used to configure the unit. Follow the instructions for using the remote control, in this case using **INPUT-** for down, **INPUT+** for up, **INFO** for left and **MODE** for right.

**...using the internal configuration web page**
The units have an internal configuration page that presents the same set up functionality front panel display on a web browser.

To access the internal configuration page, find the units’ IP address by selecting Network > IP Address. Type the IP address in the browser window.

The menu headings and function are the same in the internal configuration page and the front panel and are described below.
Input Config.
The audio and video settings on this page of the Setup menu can be tailored specifically and independently for the currently selected input. When a different input is selected on the Input line, all the input-specific settings for that input are displayed below it. These settings are applied to the named input only and are stored in memory and recalled each time the unit is powered up and whenever that input is selected.

Input – The currently selected input connects to which the settings below relate.

Name – The display name of the input. You can change the name of any input to more closely match your setup. For example, if you had two satellite receivers, you could connect the main receiver to the SAT audio and video input connectors and change the Name to ‘SAT 1’. You could then connect the second satellite receiver to the UHD audio and video input connectors, but change the UHD Name to ‘SAT 2’. It is then clearer to users of your Receiver which inputs they wish to select when scrolling through.

Lip Sync – Each input can have its own setting to add a time delay between the audio and video signals to compensate for the sound and picture not being synchronised. This delay between the audio and video signals to compensate for the sound and picture not being synchronised. This delay is automatically boosted for as long as that input is selected.

Room EQ – When the Dirac Live Bass Management application is run and EQ filters are downloaded into one of the three slots available, this can be selected.

DV Calib. Offset – The Calibration Offset parameter of Dolby Volume allows you to compensate for speaker efficiencies and listening position. The default value is 0 and this should normally provide a good result when the Receiver speaker levels are set using a sound pressure level meter.

Stereo Mode – If you have configured your system to have a subwoofer, then you have the flexibility to choose how bass information is distributed between the front left/right speakers and the subwoofer when listening to stereo (two channel only) analog and digital sources. Choose the option which gives you the most solid, even sounding bass. If you are using a subwoofer for stereo, please also see Sub Stereo below to set the level of the subwoofer. For best results test with a setup disc unless Dirac EQ is active on the input. This setting can be used to override your normal speaker settings in the Spkr Types menu whenever the Receiver plays stereo material. It is quite common to some people find that two channel stereo music listening is best done with a slightly different sub/speaker setting than for surround movies.

As Spkr Types: When an analog or digital stereo source is played, your normal speaker configuration (as in Spkr Types menu) is used to reproduce the signal.

NOTE: The Stereo Mode function is not available when using an analog source in Stereo Direct mode.

Sub Stereo – If Left/Right+Sub or Sat+Sub is selected in Stereo Mode above, this setting adjusts the level of the subwoofer when the source is two channel stereo.

IMAX Mode – Selects if IMAX mode is enabled from the incoming audio stream (auto) or forced on or off.

Auro-matic 3D – Selects the mode of the Auro-matic 3D upmixer.
Small: Adjusts the upmixer for a small-sized room.
- Medium: (default) Adjusts the upmixer for a medium-sized room.
- Large: Adjusts the upmixer for a large-sized room.
- Movie: Adjusts the upmixer for film material.
- Speech: Adjusts the upmixer to focus on speech intelligibility.

Auro-Matic 3D Strength – Adjusts the ratio of unprocessed-to-processed signal when using the Auro-Matic 3D upmixer.

Audio Source – Selects the particular connection type for each input. The default is HDMI for inputs with an HDMI connection and Digital for inputs without an HDMI connection. This setting must be changed if another connection is used.

Select from the list the audio type you are using on this source.
- HDMI: the unit is forced to use the HDMI audio input for this source.
- Digital: the unit is forced to use the optical (TOSLINK) or coaxial (S/PDIF) digital audio input for this source.
- Analogue: the unit is forced to use the analog audio input for this source.

CD Direct – Turns off the compressed audio detection mute delay and should only be used for sources that will only transmit PCM audio (e.g., a CD player).

General Setup
General information and system controls.

Source Input – (Information only) The currently selected input to which the settings below relate.

Incoming Format – (Information only) The format of the digital audio stream connected to this input, if present.

Incoming Sample Rate – (Information only) The sample rate of the digital audio stream connected to this input, if present.

Incoming Bit Rate – (Information only) The bit rate of the digital audio stream connected to this input, if present.

Dialogue Normalization – (Information only) Shows the incoming video resolution.

Audio Compression – Allows selection of compression which is desired for late night listening. The compression effect increases the volume of the quiet passages and decreases the volume of the louder passages. Compression only applies to Dolby/DTS soundtrack formats that support this function.
- Off: (default) no audio compression is applied.
- Medium: compression is applied so that loud portions of a soundtrack are reduced in level. Any Dolby True HD stream is compressed automatically as set by the incoming stream.
- High: the maximum amount of dynamic range compression is applied, so that the difference between loud and quiet portions of a soundtrack is minimized.

This setting applies to all inputs when a relevant digital audio stream is detected. It is stored in memory and recalled each time the unit is powered up.

Balance – To alter the sound balance temporarily between front left and right speakers. You can alter the sound stage to either the left or the right by up to 6dB. Note that it is not possible to adjust the stereo signal to cover both channels. This function resets to equal left/right balance when the input is changed.

Dolby Center Spread – Allows adjustment of the sound field for Dolby Surround mode decoding of two-channel sources. With Dolby Surround decoding, dominant center signals come only from the center speaker. If no center speaker is present, the decoder splits the center signal equally to the left and right speakers to create a ‘phantom’ center image. The Center Spread control allows variable adjustment of the center image so it may be heard only from the center speaker, only from the left/right speakers as a phantom image, or from all three front speakers to varying degrees.

Max On Volume – Limits the maximum volume the system operates in the main zone when it is switched on or comes out of Standby. The system comes on at this stored volume setting if the last used (possibly very loud) volume exceeds this value. It is stored in memory and recalled each time the unit is powered up.

Display on time – Sets the time that the front panel display remains illuminated after receiving a command. The default is always on.

Control – Enables or disables RS232 or IP (NET) control, a system that allows control from various third-party home automation systems. Note: only RS232 or IP control can be used, not both.

Power on – Determines how the unit powers on.
- Stby: in Standby mode
- On: On
- Last state: Last state (default).

Language – Select the language for the setup menu - English, French, German, Spanish, Dutch, Russian, Chinese.

Speaker Types
Settings for the types of loudspeaker you have connected in your configuration. These settings are applied to all audio inputs and are stored in memory and recalled each time the unit is powered up.

Front Left/Right –
- Center –
- Surr. Left/Right –
- Surr. Back L/R –
- Height Front –
- Height Back –

Here you set the type of speakers that you have connected to your Receiver:
- Large: capable of full frequency range reproduction
- Small: not capable of full frequency range reproduction at the low frequency end
- None: speaker not present in your configuration.

NOTE: It is not possible to set all speakers to Small unless there is a subwoofer in your speaker configuration. If you do not have a subwoofer, you will be forced to set your front speakers to Large.

Subwoofer – configures if the dedicated Sub Out connectors, “Sub1” and “Sub2” are used for a single subwoofer channel. (Either connector may be used.) For systems with two or more subwoofers, use channels 13, 14, 15 & 16 for up to four independent subwoofers, which can fully utilize Dirac Live Bass Management.

Channel 13 & 14 –
- Channel 15 & 16 –

Configures the speaker positions that channels 13, 14, 15 & 16 are used for.

Height Type – configures the type of height speakers - ceiling mounted or Dolby enabled.

Use Channels 6+7 for – If your main zone speaker setup does not include Surround Back Left and Right speakers, you can choose to use the Surround Back amplifier channels as the Height 1 amplifiers, to Bi-Amp the Front Left and Right pair, or as a stereo power amplifier for Zone 2.

Sub Gain – configures the output level trim for all outputs configured as subwoofers in -6dB steps from 0dB to -30dB.

Subwoofer
Calibration settings for the distances between the loudspeakers and the listening position.

NOTE: Speakers that are not present in your configuration will be greyed out.

If Dirac Live is used, these settings will be shown in time (ms) and not distance. These settings are applied to all audio inputs and are stored in memory and recalled each time the unit is powered up.

Units – Select whether you wish to measure distances in imperial or metric units.
Speaker Levels

These settings allow adjustment of individual speaker levels. These settings are applied to all audio inputs and are stored in memory and recalled each time the unit is powered up.

NOTE: Speakers that are not present in your configuration will be greyed out.

Test Tone – selects the internal test tone generator or allows the use of an external test tone from the currently selected HDMI input (e.g. played from a BD).

Front Left –
Center –
Front Right –
Surround Right –
Surround Back Right –
Surround Back Left –
Surround Left –
Left Top Front –
Right Top Front –
Left Top Back –
Right Top Back –
Subwoofer –
Channel 13 –
Channel 14 –
Channel 15 –
Channel 16 –

As described in “Essential Setup” on page EN-28, measure the distance from each loudspeaker in your system to your ear in the main listening position and enter the values. This allows the Receiver to calculate the correct relative delay for each loudspeaker.

VIDEO SETTINGS

Video Inputs

Settings to optionally assign a video source to each of the normally audio-only inputs.

These settings are stored in memory and recalled each time the unit is powered up.

Video Input CD –
Video Input Aux –
Video Input FM –
Video Input DAB –
Video Input Net –
Video Input BT –
The default for each of the audio inputs is ‘None’. You could, however, associate ‘Sat’ video with FM or Digital Radio audio to receive radio commentary of a sports game with pictures from satellite coverage, for example.

HDMI Settings

The settings in this menu control the output resolution from the video processor in the Receiver. These settings are applied to all video inputs and are stored in memory and recalled each time the unit is powered up.

Zone 1 OSD – Selects whether the main zone pop-up OSD messages are On or Off. It is stored in memory and recalled each time the unit is powered up.

When On, all user adjustments that are made during the general use of the Receiver are displayed on screen as well as the front panel display. This includes the adjustment of volume, subwoofer level, lip sync, tone controls, etc. It is stored in memory and recalled each time the unit is powered up.

When Off, the above user adjustments will not appear on screen, only on the front panel display. This leaves the picture on your display device clear of pop-up text. However, regardless of this setting the Setup menus are always displayed on screen.

Zone 1 Out – This setting controls the output for zone 1 from either output 1, output 2 or both.

Zone 1 Lip Sync – (Information only) Displays how much lip sync is automatically applied to the HDMI output to compensate for video processing delays in the attached display device. Not all display devices support this function.

HDMI Audio to TV – This setting controls the audio being sent direct to the TV.

HDMI Bypass & IP – This setting controls the functionality of HDMI bypass & IP control while in standby. Selecting “Low Power” (default) will mean that IP control (network) and HDMI bypass are disabled. Selecting “HDMI & IP On” means that IP Control (network) & HDMI bypass is enabled.

HDMI Bypass Source – Selects which input is used for HDMI bypass function, either a specific input or the last input used.

CEC Control – Selects if CEC control is enabled on output 1.

eARC Control – This setting enables/disables volume control from the display.

TV Audio – This setting enables/disables auto-switching to eARC audio from the display.

Power Off Control – This setting enables/disables auto-power control from other CEC-enable devices.

Zone Settings

Lists the volume and control settings for Zone 2. These settings are applied to all audio inputs and are stored in memory and recalled each time the unit is powered up.

Z2 Input – Selects the input to be routed to Zone 2. The default is “Follow Z1”, i.e. the same source as currently selected in Zone 1.

Zone 2 Status – Selects if Zone 2 is in Standby or On.

Zone 2 Volume – The current volume in Zone 2.

Zone 2 Max Vol – Limits the maximum volume setting the system can be turned up to in the Zone 2. This is a useful feature to prevent accidental overdriving of low-power handling speakers, for example.

Zone 2 Fixed Vol – The Zone 2 volume control can be locked at the current value for use with an external amplifier with its own volume control in Zone 2.

Zone 2 Max On Vol – Limits the maximum volume the system operates in the Zone 2 when it is switched on or comes out of Standby. The system comes on at this volume if the last used (possibly very loud) volume exceeds this value.
Connecting to a Network

Network
The Receiver is fitted with a network audio client which is capable of Airplay 2, and Google Chromecast built-in as well as stored music on a network storage device such as a PC, or on NAS drive.
The wireless network is configured using the Apple Airplay setup or the Google Home app.

SSID – (Information only) Displays the SSID the receiver is currently connected to, “wired” if a wired connection is used, or “not connected” if no connection is present.
IP Address – (Information only) IP address assigned by the DHCP server, or if not using DHCP, the IP address you have assigned to the Receiver for your network.
MAC address – (Information only) The unique address of the network card in your Receiver.
Friendly name – (Information only) The network ‘friendly name’ of your Receiver.

Bluetooth
The Receiver is fitted with a Bluetooth audio input.

Pair Device – Makes the Receiver discoverable by Bluetooth devices.
Clear Paired Device List – Clears the Receiver’s list of paired Bluetooth devices.
Paired Devices – Displays a list of the devices paired with the Receiver.

Airplay Setup
In order to use the Airplay and ChromeCast functionality of the Receiver you will need to connect it to your home network via a wireless or wired connection.
The following sections detail how to do this.

Note: Before attempting to setup a wireless connection ensure the supplied wireless antennas are fitted to the antenna sockets on the rear of the Receiver.

Home Automation Control
When connected to a network the Receiver can be controlled and monitored remotely using dedicated home automation software.
The same controls are also available via the RS232 input.
Various third-party systems are available providing sophisticated control over all your entertainment devices. Contact your dealer or installer for details. The technical details of the remote control protocol are available upon request, by contacting JBL Synthesis at csupport@harman.com
For details of the available controls please refer to the control document which can be found at www.jblsynthesis.com for further information.

ChromeCast Built-In Setup

Wired Connection
Connect an ethernet cable to the Receiver.

Note: The Receiver will appear as JBL SYNTHESIS modelname-xxxxxx in the Airplay speaker setup menu, where xxxxxx is the last 6 digits of the units MAC address.

Wireless Connection
Ensure your Apple device is connected to the wireless network you wish to connect the Receiver to.
Open the Wi-Fi settings menu on the Apple device and select the Receiver from the “Set up new airplay speaker” menu.
Follow the instructions on screen. To listen to audio via Airplay on your Receiver, ensure your Apple device is connected to the same network as the Receiver and simply select the Receiver as the Airplay audio playback device.

Note: The Receiver will appear as JBL modelname-xxxxxx in the playback menu, where xxxxxx is the last 6 digits of the units MAC address.

Wired & Wireless Connection
Download and open the Google Home application.

You should be prompted that there is a device available for setup. If not simply tap “Add” followed by “Setup a Device”.
Select the Receiver and follow the instructions on screen.
To listen to cast audio from any supported application on your Receiver, ensure your device is connected to the same network as the Receiver. Tap the ChromeCast built-in icon from within the application and select the Receiver as the playback device.

Note: The Receiver will appear as modelname-xxxxxx in the setup menu, where xxxxxx is the last 6 digits of the units MAC address.
Introduction

Your Receiver provides all the key decoding and processing modes for analog and digital signals, including the latest high definition audio formats over HDMI.

Modes for digital sources

Digital recordings are usually encoded to include information about their format type. The Receiver automatically detects the relevant format in a digital signal – such as Dolby Atmos, TrueHD, Dolby Digital Plus, DTS:X, DTS-HD Master Audio, Auro 3D, Dolby Digital, or DTS – and switches to the appropriate decoding.

Modes for analog sources

Analog recordings do not contain information about their encoding formats, so the desired mode – such as Dolby Surround – needs to be selected manually.

Mode memory

Dolby Digital or DTS audio (including the high definition formats) can be output in two mix modes, selected using the button:
- Surround (e.g., five main channels plus a subwoofer for a 5.1 source)
- Stereo downmix.

When two-channel audio, regardless of whether it is analog or digital, can also be output in two mix modes, selected using the mode button:
- Surround (e.g., Dolby Surround, DTS Neural:X, etc.)
- Stereo

The Receiver stores the settings for each source. Thus the decoding mode for the following groups of source material can be stored independently:
- Dolby Digital (multi-channel) and DTS source material
- Two channel Dolby, PCM or Analogue source material

Two-channel source modes

The following decoding and surround modes are for creating multi-channel stereo modes from 2-channel sources. They are available on the Receiver for standard and high definition Dolby Digital 2.0, DTS 2.0, PCM or analog sources:

Stereo –
- 16 Channel Stereo –
- Dolby Surround –
- Dolby Virtual Height -
- DTS Neural:X -
- DTS Virtual:X -
- Auro-matic 3D -

Auro-matic 3D

Auro-matic 3D creates an immersive audio experience by creating additional channels from the incoming audio to match the available output channels, enhancing the listening experience.

Logic 16

Logic 16 is an advanced up-mixer which produces astonishingly natural three-dimensional sound. Designed by Harman research scientists and engineers, Logic 16 will up-mix any input source from mono up to 15.1, including all Dolby formats.

Multi-channel source modes

For many years, digital multi-channel source material was often provided as ‘5.1 audio’. The ‘5.1 channels’ are comprised of: left, center and right front speakers, two surround speakers and a low frequency effects (LFE) channel. Since the LFE channel is not a full range channel, it is referred to as ‘1’.

Dolby Atmos, DTS:X, DTS-HD, Auro 3D are high-resolution immersive surround formats which use object oriented audio technology to deliver additional sonic locations for the sound requiring additional speakers including height (ceiling) speakers. The SDR-35 and SDP-55 natively decode 9.1.6, where the last number (6) represents the height speakers.

Decoding modes

The modes given in the following table are available for multi-channel digital sources:

Special modes such as DTS-ES 6.1 discrete, Dolby Digital Plus, Dolby TrueHD, Dolby Atmos, DTS:X, DTS-HD and IMAX® ENHANCED, Auro 3D are only available from the correct source material.
**High resolution audio sources**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dolby Atmos</td>
<td>Dolby Atmos content is mixed as audio objects instead of traditional channels, so can take full advantage of the number and placement of your speakers.</td>
</tr>
<tr>
<td>Dolby TrueHD</td>
<td>Provides up to 7.1 full channels at 96kHz, 24bit resolution, with no losses in the compression process. Data rates can be up to 18Mbps.</td>
</tr>
<tr>
<td>Dolby Digital Plus</td>
<td>Provides up to 7.1 discrete channels of audio with less compression than traditional Dolby Digital encoding. Data rates can be up to 6Mbps.</td>
</tr>
<tr>
<td>DTS-HD Master Audio</td>
<td>Provides up to 7.1 full channels at 96kHz, 24bit resolution, with no losses in the compression process. Data rates can be up to 24.5Mbps.</td>
</tr>
<tr>
<td>DTS:X</td>
<td>DTS:X is a decoder package that renders immersive content which has been encoded with DTS:X encoding. DTS:X content consists of audio objects or a combination of audio channels and objects. The DTS:X decoder package also plays back legacy DTS formats including DTS-HD Master Audio lossless and lossy streams. Supports greater than 7.1 channel output configurations (including height speakers) Provides &quot;Dialog Control&quot; so consumers can adjust the sound to their preference or the listening environment Remaps any DTS content to any speaker layout Supports Blu-ray Disc (BD), DVD and streaming media formats, and legacy streams up to 192kHz. Includes Neural:X, the latest upmixing/downmixing technology from DTS.</td>
</tr>
<tr>
<td>IMAX ENHANCED</td>
<td>IMAX® Enhanced products meet the highest level of standards, ensuring the best color, contrast, clarity and sound on the market. These are products endorsed by IMAX to fully deliver the most immersive at-home entertainment experience and leverage the full quality and scale of IMAX Enhanced content. The IMAX Enhanced program introduces a new standard in home entertainment.</td>
</tr>
<tr>
<td>AURO 3D</td>
<td>AURO 3d is a decoder package that renders the audio at three levels - ear level, height level and the &quot;Voice of God&quot; level, creating an immersive sphere of audio.</td>
</tr>
</tbody>
</table>

**For Dolby Digital sources**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dolby Digital 5.1</td>
<td>Dolby Digital 5.1 sources deliver sound with five discrete full-range channels; left, center, right, surround left, surround right, plus LFE channel.</td>
</tr>
<tr>
<td>Dolby Digital Stereo Downmix</td>
<td>Provides a stereo downmix of the source material for use with headphones.</td>
</tr>
<tr>
<td>Dolby Digital 5.1 + Dolby Surround</td>
<td>This mode is used to derive information for the individual surround back channels from the surround channels, using the Dolby Surround decoder.</td>
</tr>
</tbody>
</table>

**For DTS sources**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DTS 5.1</td>
<td>Less common than the Dolby Digital format, but generally recognized within the audio industry as being of superior sound quality. DTS 5.1 delivers surround sound with five full range channels plus an LFE channel.</td>
</tr>
<tr>
<td>DTS 5.1 Stereo Downmix</td>
<td>Provides a stereo downmix of the source material for use with headphones.</td>
</tr>
<tr>
<td>DTS-ES 6.1 Matrix</td>
<td>This is a 6.1 channel format based on DTS 5.1. It has the sixth channel matrix encoded into the surround left and surround right channels. The sixth channel is a surround center channel and is directed to the surround back left and surround back right speakers.</td>
</tr>
<tr>
<td>DTS-ES 6.1 Discrete</td>
<td>This is a true discrete 6.1 channel sound format. DTS-ES discrete mode operates only on sources with DTS-ES 6.1 discrete audio encoding.</td>
</tr>
<tr>
<td>DTS96/24</td>
<td>Provides up to 5.1 channels of audio at 96kHz, 24bit resolution for superior sound quality compared to standard DTS 5.1</td>
</tr>
</tbody>
</table>
Tuner Operation

The Receiver is fitted with an FM/DAB/DAB+ (digital radio) tuner. DAB broadcasts are not available in all locations.

This section deals with tuner operation, for information on setting up the tuner and installing antennas, see page EN-13.

When a tuner input is selected, the OSD shows a list of radio presets plus an information panel giving all available information about the current frequency (for FM) or station (for DAB).

The front panel will also give the same information, pressing the INFO key will cycle through the various items of information:

<table>
<thead>
<tr>
<th>FM</th>
<th>DAB</th>

</tr>
<tr>
<td>Signal strength</td>
<td>Signal quality</td>
</tr>
</tbody>
</table>

FM analog radio
Frequency tuning on FM radio is performed using the < and > buttons on the remote control in TUN device mode. Individual presses move the frequency down and up one step. If you press and hold either of the tuning buttons for two seconds, the tuner scans to the next strong signal. You can stop a scan at any time by pressing one of the tuning buttons again.

In Europe, the internal FM radio is capable of receiving RDS (Radio Data System) radiotext signals that are transmitted on some stations. The RDS information typically includes the radio station name, the music or speech genre as well as additional information related to the current program. On music stations this is often information on the currently playing track.

DAB digital radio
Digital Audio Broadcasting (DAB) radio is becoming more widely available.

See www.worlddab.org/country_information for information on DAB availability.

You will need to scan for available stations before being able to listen to them.

To scan for DAB stations, first select the DAB tuner then press and hold until the display indicates scanning has started. The Receiver will then scan all the DAB radio frequencies and compile a list of the stations that are available.

When the scan is complete, you can scroll through the station list using the < and > buttons on the remote control. To listen to the currently displayed station press the OK. If you do not press OK within two seconds, the display will revert to displaying the currently playing station.

Tuning/Channel Selection
When switching to the internal TUNER source, the Receiver enters the last used tuner band, be it FM or DAB. Repeatedly pressing RADIO cycles through the available tuner bands on your Receiver.

FM analog radio
Frequency tuning on FM radio is performed using the < and > buttons on the remote control in TUN device mode. Individual presses move the frequency down and up one step. If you press and hold either of the tuning buttons for two seconds, the tuner scans to the next strong signal. You can stop a scan at any time by pressing one of the tuning buttons again.

In Europe, the internal FM radio is capable of receiving RDS (Radio Data System) radiotext signals that are transmitted on some stations. The RDS information typically includes the radio station name, the music or speech genre as well as additional information related to the current program. On music stations this is often information on the currently playing track.

DAB digital radio
Digital Audio Broadcasting (DAB) radio is becoming more widely available.

See www.worlddab.org/country_information for information on DAB availability.

You will need to scan for available stations before being able to listen to them.

To scan for DAB stations, first select the DAB tuner then press and hold until the display indicates scanning has started. The Receiver will then scan all the DAB radio frequencies and compile a list of the stations that are available.

When the scan is complete, you can scroll through the station list using the < and > buttons on the remote control. To listen to the currently displayed station press the OK. If you do not press OK within two seconds, the display will revert to displaying the currently playing station.

Saving and Selecting Presets
Preset selection uses the < and > keys on the remote to browse and OK to select the preset when the remote is in TUN device mode.

Up to 50 presets can be stored and these can be from any band, for example, preset 1 could be an FM station, preset two a DAB station, etc. Pressing the OK key causes the next available preset number to be displayed, then pressing the OK key again stores the current frequency/channel in that preset. If a different preset number is required, press the < and > keys until the desired number is displayed before pressing the OK key for a second time.

Deleting Presets
When in tuner browse mode (using < and > to scroll through the presets), the yellow button on the remote is used to delete the currently highlighted (but not playing) station or frequency.

MusicLife APP
The MusicLife™ app facilitates playback of your own music library stored on a computer, NAS drive, or USB flash drive.
# Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Check the following</th>
</tr>
</thead>
</table>
| There are no lights on the unit | - The power cord is plugged into the receiver and into the AC power outlet.  
- The power button is pressed in.  
- If a red LED is present, the receiver is in standby mode. Press any button on the front panel or the standby button on the remote control. |
| The unit responds erratically or not at all to the remote control | - There are fresh batteries in the remote control.  
- The front panel window is visible and you are pointing the remote control towards it. |
| The front panel display is blank | - The display hasn’t been turned off. Press the **DISPLAY** button on the front panel or remote control. |
| No picture is being produced | - Your viewing device is turned on and switched to display your receiver. Test by pressing the **MENU** button on the receiver or on the remote and look for the main menu screen on your display device.  
- The correct video input is selected on the receiver.  
- The video source is on, is operating normally, and is in ‘play’ mode if appropriate. |
| There are bright edges or ‘ghosts’ on the picture | - Ensure the ‘sharpness’ control on your display device is switched off or set to near minimum.  
- For hdmi connections, try using a shorter cable or alternatively a different brand. |
| No sound is produced | - The correct input has been selected.  
- The ‘audio source’ has been set correctly in the ‘input config’ Menu  
- The source equipment is on, is operating normally and is in ‘play’ mode if appropriate.  
- The volume is turned up to a reasonable level and the receiver is not in mute mode. |
| The sound is poor or distorted | - You have not excessively increased the input sensitivity (i.e. Reduced the maximum input signal voltage) in the input config. Menu if an analog input is being used.  
- You have selected the correct size of speakers to suit your system in the setup menu. |
| Sound only comes from some of the speakers | - You have an appropriate surround source selected and playing.  
- The BD/DVD disc is encoded in the appropriate format, and the correct format has been selected in the disc start menu of the bd player (if applicable).  
- The BD/DVD player has been set to output ‘bitstream’ audio on the digital output.  
- The display window indicates that the disc you are playing is a multichannel recording (you may need to press the **INFO** key several times until you get to the ‘incoming format’ display).  
- All the speakers are correctly connected to the speaker terminals and are secure.  
- You have not selected ‘stereo’ as the decoding mode.  
- Your speaker balance is correct.  
- You have configured the receiver to include all the speakers in your system. |
| Unable to select Dolby or DTS decoding modes | - The receiver can only apply Dolby an DTS decoding to sources which have been encoded in the same format.  
- Check that:  
  - Digital source is selected and connected.  
  - The source is playing appropriately encoded material.  
  - The BD/DVD disc is encoded in the appropriate format and that the correct format has been selected in the disc start menu of the bd player (if applicable).  
  - The BD/DVD player has been set to output ‘bitstream’ audio on the digital output. |
| When playing a Dolby BD/DVD, the AV selects Dolby Surround | - You have a digital connection from your BD/DVD player.  
- Sometimes dolby BD/DVD discs contain material at either the beginning or the end of the main movie that is not in full 5.1 Format, but in two-channel. |
| Hum on an analog input | - All cables are making a good connection. If necessary remove the cable from the connector and plug it fully in again (turn the power off before doing this).  
- The connections inside the source cable connector are not broken or badly soldered.  
- If the hum originates only when one particular source component is connected, that an antenna cable, or satellite connection to this source is ground isolated. Contact your installation contractor. |
<table>
<thead>
<tr>
<th>Problem</th>
<th>Check the following</th>
</tr>
</thead>
</table>
| There is radio or television reception interference                     | ❑ Where the interference is coming from. Switch off each source component in turn, then any other equipment. Most electronic equipment does generate low levels of interference.  
❑ Try re-arranging cabling from the nuisance source away from other cabling.  
❑ Ensure that the cabling used is high quality, specified for its purpose, and is properly shielded.  
❑ If the problem persists, contact your dealer. |
| The source changes randomly or freezes on one source                   | ❑ There are no static or impulse interference problems caused by nearby power equipment switching, such as heating or air conditioning control. Switch the receiver off, wait ten seconds, then switch it on again to clear an operating problem. Contact your installer if the problem returns or persists.  
❑ There is no direct sunlight shining on the infra-red detector behind the front panel display. |
| Volume is always too loud when I turn on                               | ❑ The ‘max on volume’ setting is not set too high.                                      |
| If files on a NAS drive cannot be played                               | ❑ The files are in a compatible format.  
❑ The computer is connected via a network and not USB – the Receiver USB port cannot be used for a direct connection to a computer |
| If you cannot connect to a wired network                               | ❑ The Ethernet cable you are using is correctly connected between the receiver and the network hardware.  
❑ The network is set up for fixed IP addressing and you have the Receiver set to use DHCP.  
❑ The network is set up for DHCP and you have the receiver set to use fixed IP addressing. |
| If you cannot connect to a favourite internet radio station            | ❑ The station is still broadcasting or is not congested – try again later. |
| If the internet radio station sound quality is poor or broken           | ❑ The radio station has a low bit rate (use the INFO key to find this).  
❑ The network is not slow or congested. |

E&OE

**NOTE:** All specification values are typical unless otherwise stated.

---

**Continual improvement policy:** JBL Synthesis has a policy of continual improvement for its products. This means that designs and specifications are subject to change without notice.
Worldwide Guarantee

This entitles you to have the unit repaired free of charge, during the first five years after purchase, provided that it was originally purchased from a Certified JBL Synthesis dealer. The JBL Synthesis dealer is responsible for all after-sales service. The manufacturer can take no responsibility for defects arising from accident, misuse, abuse, wear and tear, neglect or through unauthorized adjustment and/or repair; neither can they accept responsibility for damage or loss occurring during transit to or from the person claiming under the guarantee.

The warranty covers:
Parts (excluding disc drives) and labor costs for five years from the purchase date (see below for additional terms and conditions). After five years you must pay for both parts and labour costs.

Disc drives (of any type) are covered under this warranty for two years from the purchase date.

The warranty does not cover battery replacement at any time.

The warranty does not cover transportation costs at any time.

Claims under guarantee

This equipment should be packed in the original packing and returned to the dealer from whom it was purchased. It should be sent with shipping costs prepaid by a reputable carrier – not by the post office. No responsibility can be accepted for the unit while in transit to the dealer or distributor and customers are therefore advised to insure the unit against loss or damage while in transit.

For further details contact JBL Synthesis at csupport@harman.com.

Problems?

If your JBL Synthesis dealer is unable to answer any query regarding this or any other JBL Synthesis product please contact JBL Synthesis Customer Support at the above address and we will do our best to help you.
